Our knowledge of the content of rarer metals in igneous rocks is fragmentary, but it is at least often the case that ore deposits formed after the eruption of an igneous rock will contain the rarer metals characteristic of it. It may be true that for each differentiated rock type there are corresponding types of deposits, varying with the conditions of deposition.

As periods of long continued differentiation may materially modify the composition of a magma it is

conceivable that this might find expression in a progressive change in the character of ore deposits successively formed during these periods. The quicksilver deposits of California, for instance, may be the ultimate result of such long continued differentiation.

Perhaps it may be thought that the limits of epochs of metallization have been drawn too closely in this paper. It is freely admitted that in many cases there may be room for doubt. But if this opening of the question will stimulate discussion of a vital subject it will have achieved its most desired result.

## SOUTH LORRAIN SILVER AREA.

Abstract of Report by A. G. Burrows, Ontario Bureau of Mines.

This area first attracted attention in December, 1907, when a promising discovery of native silver was made on a claim now known as the Keeley mine (H. R. 19). A rush followed this discovery, and soon almost the whole area was under staking as mining claims.

The central portion of South Lorrain is about sixteen miles southeast of the town of Cobalt. The camp is most easily reached during the open season, by steamer from Haileybury, from which town it is distant about twenty-two miles. Communication is continued during the winter, over a sleigh road on lake Temiskaming. A government wharf has been constructed just north of the townsite of Sixty-six. From the latter place, a good wagon road extends westerly, by way of Loon lake, a distance of three miles, to the Keeley mine. Another road has been built by the Ontario government, just north of the wharf, and opens up another stretch of country. From these roads, old timber roads or trails may be followed to any part of the area. Lumbering has been carried on for years, so that almost all the pine has been removed. During the past season, serious forest fires destroyed much timber, which would have been suitable for mining purposes.

### Topography

The surface of the country is rough and hilly, and many small lakes lie in the depressions. The shore line is bold, and the hills rise abruptly from the lake. The hills and ridges are conspicuous features, and are generally found to consist of one geological formation. In consequence, the contacts are usually in the valleys and covered. This fact is well exemplified by a glance at the map, which shows almost all the lakes to lie in contact plains.

In following the road from lake Temiskaming to the Keeley mine, there is almost a continuous ascent. The shaft at the Keeley mine has an elevation of 571 feet and the bridge south of Loon lake an elevation of 323 feet. These elevations are relative to the level of lake Temiskaming on July 15th, 1908, when the water in the lake was higher than the average. The high water elevation of lake Temiskaming is 592 feet above sea level.

### Classification of Rocks

In this area, the formations are found to conform to the scheme proposed by Dr. W. G. Miller for the Cobalt area. The writer did not, however, see any unconformity between the quartzite-arkose series and the conglomerate-slate of the Huronian formation:—

Glacial and Recent—Boulder-clay, sand, gravel, etc. Great unconformity.

Post-Middle Huronian—Diabase. Igneous contact. Huronian—Quartzite, arkose, conglomerate, slate, breccia. Great unconformity.

Laurentian—Syenite, granite, intrusive into the Keewatin, but not into the Huronian. Igneous contact.

Keewatin—An igneous complex, chiefly basic igneous rocks together with acid porphyries.

### Glacial and Recent

Over considerable of the area, there is a covering of drift, carrying the usual glacial boulders. On the summits of the ridges, the drift is sometimes very deep. The rock exposures are usually found along the slopes of the hills, where the drift is thinner. On the shore of lake Temiskaming just south of the townsite, the fine-grained rocks well preserve the glacial striae. On the main shore, just opposite a small rocky island, the striae are very striking, and are due south (magnetic). At other points along the shore, there is a little variation to the east or west of south.

In the cutting of the government road just east of H. R. 69, the clay shows a stratified arrangement. Clay hills are seen along the shore of the lake, to the mouth of the Montreal river. Five miles up the river, the clay hills are high and much cut by deep ravines.

The total distribution of the drift is not shown on the map, but only where the working out of the contacts was seriously interfered with.

### Diabase (Post Middle-Huronian).

This formation has its greatest development in the central portion of the area, extending westward from lake Temiskaming, around the north end of Loon lake, southwest to the east side of Trout lake, and north almost to the Lorrain boundary. In this area it occurs as a very prominent ridge. A smaller area is seen in the northwest portion, where it is associated with the quartzite. In appearance and texture the diabase is very similar to that described in Dr. Miller's Report on the Cobalt Area, Third Edition, and is essentially a quartz-diabase.

A marked occurrence of the diabase is a dike, about five chains in width and traceable for two miles, intruding the quartzite. This may be seen east of G. F. 26, and a short distance south of the Lorrain boundary. The dike is very fine-grained on either side, and towards the centre has the normal diabase appearance.

There are smaller patches of diabase in the basic Keewatin areas, and these are difficult to distinguish as to age. Some of them are undoubtedly of the same age as the post-Huronian diabase, but, owing to the difficulty of separation from the other rocks, are not shown on the map. A thin section of a diabase associated with the Keewatin on R. L. 468 shows rather fresh plagioclase set in the augite. The latter is greatly altered to green hornblende (uralite). Some grains of quartz are seen in the section.

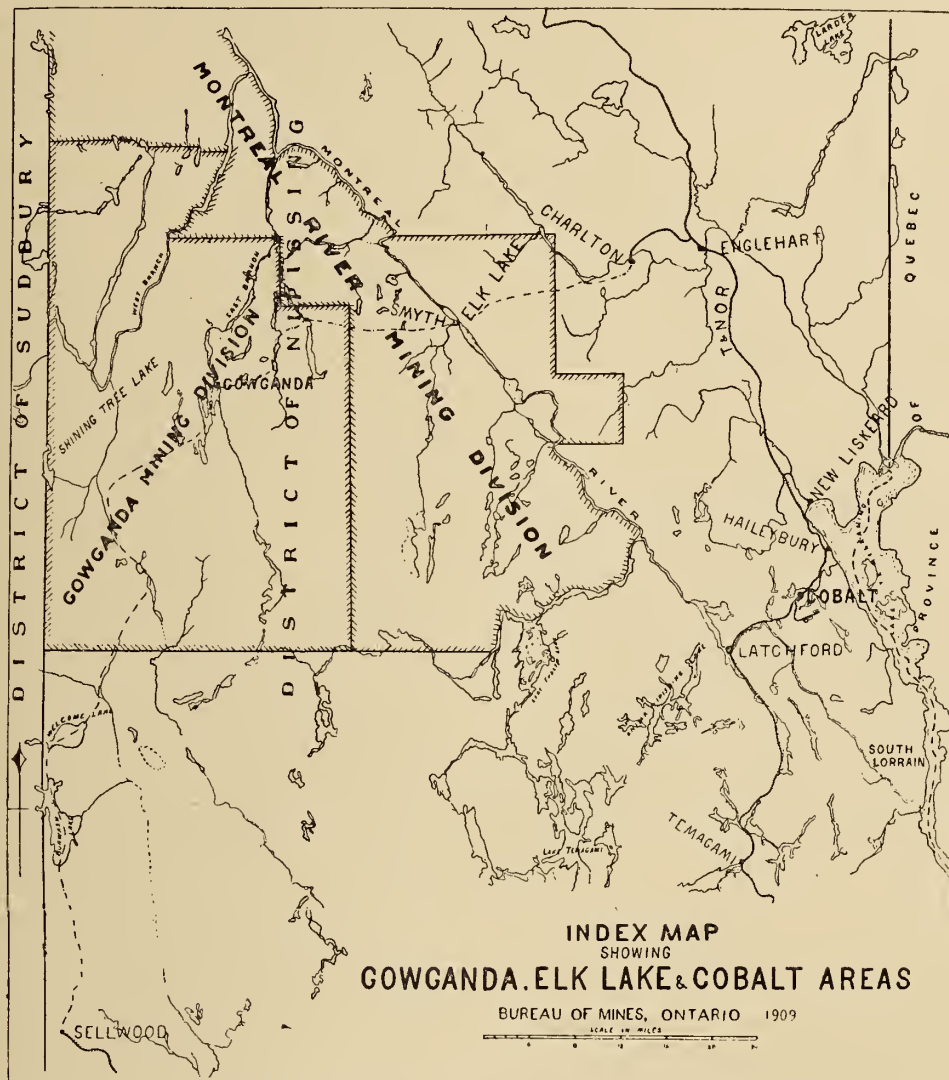

Along the north line of G. F. 12 there is a reddish granitic rock, which is apparently of the same age as the diabase, and a separation from the same magma.

river, the rock is a greywacke-conglomerate. South of Trout lake on H. R. 163, in a high rounded hill, coarse boulder conglomerate overlies well-banded slate. At the south end of the same lake and to the east, conglomerate and slate overlie the Keewatin, which shows in a bluff, and at a higher level than these in the post-Huronian diabase.

### Greywacke

Just west of the No. 3 post of H. R. 34 is an outcrop of greywacke which overlies the Keewatin and is overlain to the west by conglomerate.

The greywacke, which is deceptive in appearance, was mistaken by prospectors for fine-grained diabase.

Map showing position of South Lorrain in relation to Cobalt.

### Contact with the Huronian

Just north of the Keeley mine road, and west of Trout lake, on G. F. 13, the intrusive diabase (to the west) overlies the Huronian slate, at a high angle.

### Huronian

The predominating rocks are conglomerates and quartzites. The southern part of the area is composed essentially of conglomerates, varying considerably in appearance. The usual variety is that containing sub-angular and rounded boulders of granite, syenite and greenstone of varied size, in a groundmass of greenish porphyritic material. At the "notch" of the Montreal

### Quartzite and Arkose

The quartzite and arkose have a great development in the north and west portions of the area. They are varied in color and texture, but are usually rather medium-grained, and the lines of stratification are not very noticeable. The prevailing colors are greenish, grayish, and reddish, and, in this area, the green variety is usually rather friable, whereas the red variety is hard and compact. These varieties seem to pass gradually one into the other on the same ridge. The chief constituents are quartz and feldspar, which are occasionally present in large angular fragments. The green color is due to the presence of sericite, an alteration product

of feldspar, and was first noticed in the sea-green quartzites along the shore of lake Temiskaming. When the rock is coarse it is difficult to distinguish in the field from granite, particularly when the red feldspar is present.

In this area the prevailing dip of the Huronian rocks is to the west, varying to the northwest. Near the No. 1 post of L. O. 144, the slates dip to the west at an angle of 20 degrees. One mile west along the Keeley road from lake Temiskaming, and on H. R. 30, the slate and quartzite strike northeast and southwest and dip to the northwest. In the northwest portion of the area, near the No. 4 post of T. C. 77, the slates and quartzites dip to the southeast.

A breccia in situ is seen just east of No. 1 post, R.S. C. 68. It is composed entirely of small angular fragments of greenstone, which is seen in place to the south. This is the lowest portion of the Huronian seen in this area.

West of the Keewatin area, which is shown to the north of Trout lake, the Huronian rocks have been laid down in the following order. The Keewatin is usually overlain by a conglomerate, sometimes slaty. Above this, there is a narrow band of reddish banded slate, rather quartzose toward the upper portion, and overlying the latter there is a large area of quartzite and arkoses, with very little evidence of stratification. The breccia, mentioned above, was only noted at the one point in a very small outcrop.

#### Laurentian

The Laurentian is represented in the northeast portion of the area, by a reddish hornblende syenite, in which flesh-colored feldspar and greenish black hornblende are easily recognized. The hornblende is the common green variety, very pleochroic, and shows the distinctive prismatic cleavage and angles of the amphiboles. Quartz is present in smaller grains than the feldspar, and is not prominent enough for a granite. Sphene and magnetite occur as accessory minerals.

Throughout the syenite are rather rounded patches usually darker in color, but composed of the same constituents. These are basic secretions from the original magma, formed during the process of cooling. There are also some very small patches which are apparently remnants of a conglomerate formerly overlying the syenite.

Where the syenite comes in contact with the Keewatin to the south, it is found to be younger, enclosing fragments of the greenstone, and occasionally intruding for some distance, the older rock. On L. O. 153 the syenite is intruded by a very basic trap dike, ten feet wide and striking east and west.

#### Keewatin

The rocks of this series occur in several isolated areas. They are usually altered basic igneous rocks, both massive and schistose. The largest exposure extends N. N. E. from Trout lake for two miles. These are, in great part, greenish weathering rocks. The most typical portion is fine-grained, with a slaty appearance when fractured. Throughout the fine-grained rock are bands of coarser varieties, now much altered to amphibolite.

Just south of Loon lake on H. R. 57, the Keewatin is represented by very coarse massive amphibolites, which are highly mineralized with magnetite and iron pyrites.

Quite different in appearance from those above mentioned are the metamorphosed rocks three-quarters

of a mile south of Loon lake, and extending from H. R. 114 to lake Temiskaming. These are seen as highly tilted bands, with a general strike a little north of east and almost vertical dip to the north. At the west end of this belt the prominent rock is light colored, weathering to an ashy gray. When freshly broken it has almost a cherty appearance and is exceedingly fine-grained. Locally it is much twisted and crumpled. Thin sections of two samples of this rock showed the original character to be entirely destroyed. The constituents are exceedingly fine-grained and secondary, consisting of quartz, feldspar, chlorite and hornblende or mica.

Folded in the bands of this schistose rock are small dikes of light colored porphyries, showing phenocrysts of reddish feldspar.

A thin section from one of these dikes, near the No. 1 post of H. R. 114, shows phenocrysts of orthoclase and plagioclase, traversed by numerous small veinlets of epidote and hornblende. The groundmass is a granular mixture of feldspar and quartz, with needles of hornblende. Other dikes of porphyry are much fresher in appearance and seem to be younger in age.

On following this belt to the east, the rocks become darker in color and more chloritic. On H. R. 186, is typical chlorite schist, striking E. N. E., and dipping to the N. N. E. at a high angle. This rock breaks in curved cleavage plates, and is traversed by numerous small torsion cracks, filled with calcite. On H. R. 1 and 120 the schist is intruded by a large dike of white weathering porphyry with colorless phenocrysts of feldspar and quartz.

Small veins of quartz, impregnated with iron pyrite, cut the schist in this vicinity. On H. R. 140 one of these carries low values in gold.

There is a belt of somewhat similar Keewatin rocks immediately south of Oxbow lake.

#### Keewatin West of Point Fine

The formation consists principally of rusty, metamorphosed, basic igneous rocks, which may now be classed as amphibolites. In several thin sections, the ferromagnesian mineral is shown to be green secondary hornblende. Just north of No. 1 post R. L. 469, the amphibolite is much intersected by veinlets of rusty quartz and iron pyrites. These veinlets stand out very strikingly as a ribbed structure from the dark rock. A thin section of the rock shows it to consist of small rods and patches of green hornblende, partly in parallel arrangements, grains of epidote and clear secondary feldspar. The original character of the rock is obliterated. On H. R. 74 much of the rock is very fine-grained and intersected by veinlets of epidote and iron pyrite. A thin section shows the rock to be an alteration of fine-grained diabase, as the ophitic texture is shown clearly in the rods of altered plagioclase. The albite twinning in the feldspar is occasionally seen. The augite has been altered entirely to green hornblende. A coarser grained rock, outcropping near the No. 1 post of R. L. 465, has resulted from the alteration of gabbro. The feldspar is now altered to saussureite minerals, and the pyroxene has changed to a very pleochroic green hornblende, now showing with ragged outlines and bent forms. Only occasionally in this belt do the rocks show a schistose structure.

#### Discoveries

The principal discoveries have been made near the line of contact of the post-Middle-Huronian diabase and the Keewatin in the area to the north of Trout lake.

along this contact, usually within a quarter of a mile, discoveries of native silver or smaltite have been made in both formations. The Wettlaufer veins are in the diabase, whereas the Keeley veins are in the Keewatin. Toward the north end of this belt the discoveries so far consist of smaltite and niccolite. Small showings of native silver have been found in other isolated areas of the Keewatin or diabase. The writer does not know of any discoveries of native silver in the conglomerate or quartzite, although both these rocks are seen in contact with the post middle-Huronian diabase. In this respect the conglomerate of South Lorraine resembles that around Elk lake, in which no native silver discoveries, as far as is known, have been made.

In the following is a description of a few of the promising veins on some of the properties:—

On the Wettlaufer claim, H. R. 85, there have been found three parallel veins with a strike N. E. and S. W. Of these, the two northerly veins have rich shoots showing native silver in sheet form, while the south vein carries smaltite with low silver values. The veins are narrow, but parts of them attain a width of six inches. Flake silver is shot into the diabase wall rock from one to three inches. The distance from the north to the south vein is about ninety feet. A shaft is being sunk in the north vein and the intention is to crosscut to the other veins.

At the Keeley mine, H. R. 19, considerable development has been done. At the shaft on the main vein, No. 1, the strike is S. 62 E. The silver occurs in wire form, flake-like sheets and hair-like tufts, associated with smaltite in a gangue of quartz and calcite. Quartz is very prominent in the vein, and is associated with the best values.

The following additional information is supplied by Major Boyd Magee, superintendant of the property. "The main shaft on the original discovery has been sunk to a depth of 133 feet. At the 65-foot level, 220 feet of drifting has been done on the vein, and about 10 tons of shipping ore have been taken out and bagged. The shaft is in the Keewatin formation. Dikes of old diabase have been encountered. At a depth of 130 feet, a crosscut is being driven to catch the main vein which dipped from the shaft at a depth of 78 feet. Associated with the ore is more or less cobaltite. A sulphide of copper and silver, probably stromeyerite, has been found in the No. 1 vein. No. 3 shaft sunk on a cobalt vein has run into shipping ore at a depth of 30 feet."

A sample of massive ore from a vein near the west side line of this property, analyzed by Mr. N. L. Turner, Provincial Assayer, shows it to be smaltite-chloanthite, with the following composition:—

|               |                 |
|---------------|-----------------|
| Cobalt .....  | 10.00%          |
| Nickel .....  | 8.16%           |
| Arsenic ..... | 68.72%          |
| Sulphur ..... | .42%            |
| Silver .....  | 8.7 oz. per ton |

On H. R. 21 there are several calcite veins and one of them has shown on development native silver. This vein is near the east side line and strikes about N.N.E. A shaft has been sunk to a depth of 40 feet. The gangue is calcite, which has a very fine cryptocrystalline texture, associated in bands with quartz and decomposed material. Leaf silver, in small flakes, has been found across the vein, associated with smaltite, copper pyrites and native bismuth. Minute crystals of chloanthite are scattered through the gangue.

On H. R. 16 (Haileybury Silver Mining Company) the original discoveries were smaltite and niccolite. A sample of the massive ore has the following composition:—

|               |        |
|---------------|--------|
| Cobalt .....  | 15.92% |
| Nickel .....  | 11.18% |
| Arsenic ..... | 60.38% |
| Silver .....  | trace  |

The vein has a strike of S. 20 E., and dips 70 to the east.

On this vein a shaft has been sunk to a depth of 100 feet, and about 15 tons of massive smaltite have been obtained. Only 17 feet of drifting have been done at this level. The chief vein filling is calcite and decomposed material.

Later a vein showing native silver was discovered on the south half of the claim. The silver is associated with smaltite. A shaft has been sunk on the vein to a depth of 75 feet. At this level drifting was carried 40 feet to the northeast and 40 feet to the southeast. The veins on this property are in the Keewatin.

On H. S. 42 (Forneri claim) there is a vein about 3 inches in width, with strike N. N. E., and occurring in the conglomerate. The vein material is smaltite and copper pyrites in calcite and quartz. A surface sample on assay showed no silver values. A shaft has been sunk to a depth of 75 feet. At 35 feet the vein dipped from the shaft. It is reported that silver values were obtained on assay at 14 feet depth.

On R. L. 471, near the east side line, there is a strong vein of massive smaltite, on which a shaft has been sunk 65 feet. The vein is in the Keewatin.

On H. R. 106, adjoining Trout lake on the northeast, a five by seven shaft has been sunk 50 feet on a calcite vein carrying smaltite.

On T. C. 73 there is a shaft down 40 feet on a calcite vein with disseminated smaltite and copper pyrites. These veins have not proved to carry appreciable silver values. The rock is the later diabase.

On H. R. 69 (Maiden claim) there has been extensive development work. Near the east side line, a tunnel has been driven from the base of a hill a distance of 206 feet on a calcite vein. At 100 feet a winze has been sunk to a depth of 60 feet. The vein in places has a width of 12 inches. Smaltite and niccolite are found in bunches in the vein. Low silver values are reported to have been obtained on assay. On vein No. 2 to the west a tunnel has been driven 176 feet. The vein filling is chiefly calcite with smaltite and niccolite in portions of the vein, 5 to 7 inches in width. The veins are in the Keewatin just north of the contact with the late diabase and strike a little east of north.

On H. R. 14, near the west side line, some native silver has been obtained in a narrow vein in the diabase.

On T. C. 71, east of Loon lake, a tunnel has been driven 100 feet on a strong calcite vein about a foot in width.

At other parts of this area there has been considerable prospecting, consisting of trenching and sinking of small pits and shafts. Calcite veins are the most common type, the calcite being usually associated with more or less quartz, and carrying smaltite and niccolite occasionally. These latter minerals have been found on a number of claims in well-defined veins.

Aplite dikes which are characteristic of many of the silver showings in the township of James and vicinity are of little importance in South Lorraine.

# LEAD SMELTING AND REFINING PRACTICE AT TRAIL, B.C.

By A. J. McNab.

The Trail Smelter was built by Mr. F. August Heinze in 1896, to treat Rossland copper-gold ores only. In 1898 it was acquired by the Canadian Smelting Works. The new management at once began enlarging the capacity of the plant, and in 1899 installed the lead smelting department. This, in accordance with the standard practice of the time, consisted of hand and Bruckner furnaces for roasting, and rectangular blast furnaces for reduction. The plant consisted of three blast furnaces, ten hand roasters and six Bruckners. At this time no refinery was built, the bullion being shipped to San Francisco, where it was refined in bond. In order to save the heavy freight and refining charges, it was decided to build a refinery, and, in 1902, after careful experiment, the Betts Electrolytic Process was installed, the capacity being ten tons. This was enlarged successively in the years 1904 and 1905 to 20 and 50, and in 1906 to 75 tons—its present capacity. During this time the main changes in the smelting department were the abolition in 1906 of the hand roasters and Bruckner furnaces and the installation of the Huntingdon and Heberlein roasting furnaces and converters, the first installation being two Huntingdon and Heberlein roasters and twelve converters. In 1907—1908, four more roasters and twelve more converters were added, and two additional roasters are now being built, making eight in all, with twenty-four converters.

The ore supply is obtained from all parts of the province, Trail being the only customs smelter; in fact the only lead smelter in operation in British Columbia at the present time. The main supply comes from the St. Eugene mine, East Kootenay, owned by the Consolidated Mining & Smelting Company. This mine supplies about 75 per cent of the total lead produced. The remaining 25 per cent is almost entirely derived from other mines in East Kootenay and the Slocan districts. The lead tonnage produced from other sections being a negligible factor.

The ores are mainly sulphide, 80 per cent, being heavy galena ore or concentrates, running from 45 per cent to 75 per cent, lead. The tonnage of oxidized lead ore is small, not being over 10 per cent, while the balance of the tonnage is dry gold and silver ores with some gold concentrates from stamp mills. This preponderance of heavy sulphide ores necessitates a marked difference in policy from that followed by other lead smelters on this continent, as the conditions outside this province usually furnish the reverse features, viz., a comparatively small tonnage of heavy galena ore and concentrates, and a large tonnage of dry ores, iron concentrates, etc. This, as will be noticed later, compels a high percentage of lead on the charge, 35 per cent—45 per cent, as against the common practice of 10 per cent—15 per cent.

**Sampling and Bedding:**—The oxidized lead and dry ores are sampled in a mill equipped with Vezin samplers crushing the sample to  $\frac{1}{4}$  and the reject to a 6 ring. This reject goes direct to the lead furnace charge bins. The heavy galena ores and coarse concentrates are crushed to  $\frac{1}{4}$  and bedded, the sample being taken with Vezin samplers as above,  $\frac{1}{500}$ th being the amount cut out. The fine concentrates are usually sampled by the fifth shovel method and bedded direct. In bedding it

is aimed to secure a mixture with about 50 per cent of lead, only ore being bedded; lime rock, lead matter and a small amount of the ore (which, with the beds, constitute the roaster charge) is added later. At one time it was the practice to add the necessary amount of time rock and matte to the beds; but on account of the beds freezing in winter, which rendered a uniform mixture impossible, the extra expense of handling, together with a want of elasticity, which rendered a sudden change in the charge difficult, it was abandoned. The beds are large flat bins with a capacity of from 600 to 700 tons and are provided with tracks, etc., to enable the ore to be spread out in layers of a uniform thickness, so that in smelting the bed a fairly constant mixture shall be obtained.

**Making up Charges, Mixing and Roasting:**—The charge for the H. and H. roasters requires to be made up with a certain content of lead, iron, silica and lime to work well in the roasters and converters, and later in the blast furnace. In fact, the roasting department is the most important part of a lead smelting works; and the experience here has been, that with a good roast there is little or no furnace trouble, whereas with a bad roast furnace complications are considerable. We find that for our usual conditions the most economical roast will analyze about as follows:—

Lead 40—44 per cent; tin 10—13 per cent; silica 8—11 per cent; lime 7—10 per cent; zinc under 10 per cent.

This material when properly mixed, roasted and converted will give a fairly hard, dense product of a yellow or grayish-yellow colour, showing considerable litharge, will make but little fines and will be fairly easily broken. It will run fast in the blast furnace with a cool top, clean slags and bright tuyères. We have found some difficulty in getting a good roast with over 45 per cent lead in the roaster charge, the sulphur being usually high; but we have not had occasion to try it since installing the mixer, and that might make some difference. The difficulty seemed to be that in places the charge would not be sufficiently stiff, the galena fusing before roasting much, and in the fused condition it is almost impossible to roast it. With a properly mixed charge this might not occur and several per cent more lead might be carried. We have never had occasion to run our lead lower than 38 per cent, over any lengthy period. This gives a good product if the other constituents are properly proportioned; in fact, a 38 per cent, is, we think, preferable to 42 per cent, as it runs a little faster and gives less trouble. If our ores were suitable, we would run about 38 per cent—40 per cent lead, as on the whole it would be little more satisfactory, being, for example more easily broken. But this difficulty is not so great that it would pay us to dilute our charge with ores carrying a low treatment rate. The iron ought at the least to be as high as the silica, and it is better to have it one or two per cent higher. We have been compelled at times to run our roast with from 2 per cent to 3 per cent and even 4 per cent higher silica than iron and we have always had trouble. It did not seem to interfere with the sulphur elimination at all, as that would be as good if not better than ever; but do as we would, the tonnage would fall.

off badly, the slags would get higher in lead and there was a great tendency for the heat to get up in the furnace. We varied the rest of the blast furnace charge in every way we could think of, carried our lime in the slags high and carried it low, tried the coke higher and lower, varied the amount of slag, changed the feeding and the blast but with no very decided improvement. But on changing the analyses of the roast, all our troubles would disappear in a short time. The only explanation that we can see is that the high silica roast was too fusible, fusing too high in the furnace, which would cause the bad reduction, hot top, and slow running. We have no data on the relative fusing temperatures of the two roasts, and consequently have no facts to base our assumption on, but it seems to be the only one to fit the results and one would imagine the higher silica roast would have a considerably lower melting point. This would be a rather interesting but a difficult point to determine on a small scale, as it would be hard to get the roast sufficiently uniform so that a small piece would accurately represent it. However, if a series of determinations on each kind were made, the average would probably be very near correct.

We run the lime between 7 per cent. and obtained 10 per cent. This, with our conditions, represents about the limits. We have never too good results with the lime below 7 per cent; as a rule we run it about 8 per cent to 9 per cent. However, if we had suitable ores to enable us to keep our iron up, that is to keep about the same total percentage of iron and lime, and keep the lead down to 42 per cent, it might work well. We have never had ores to enable us to try this, as we are somewhat short of iron and are compelled to use lime to keep our lead down. Another reason is that the product is difficult to break when the lime gets too low. We have never run the lime higher than 10 per cent; in fact, we always keep it as low as possible, because it is not economical, as we have to add most of our  $\text{CaO}$  as  $\text{CaCO}_3$ , which has to be charged with the cost of roasting.

The roaster charge is accurately figured and carefully weighed, being made up with bedded ores, lime rock, stamp mill concentrates and matte, from the furnace, that is too high in lead and too low in copper to be concentrated. This charge is put through a cylindrical mixer, one mixer handling the material for four furnaces. This discharges the material into an elevator, discharging into chutes which convey the material to the furnace feed hopper.

(To be continued.)

### EXCHANGES.

**Mines and Minerals, July, 1909.**—Birds in their little nests do quarrel sometimes. The Engineering and Mining Journal now believes that there is some connection between earthquakes and coal-mine explosions. Because Mines and Minerals did not believe, the E. and M. J. called it names. Mines and Minerals replies by classing E. and M. J., in point of modernity, with the horse cars that still survive in New York.

Both of our hot-headed contemporaries are old enough to know better. Apart from the waste of valuable space, this interchange of brickbats is exceedingly bad taste. Apologies are due from both belligerents.

**The Engineering and Mining Journal, July 3, 1909.**—"Speculation in Copper" is the title of the leading editorial in this issue.

The London Metal Exchange, which in effect is international, serves as a balance wheel, and the prices for copper at New York and London can never be for long out of joint.

Last year outside interests, having no direct concern with the metal industry, participated in copper speculation. The active movement of the copper market has attracted several classes of speculators. Thus a gambling spirit has been injected into the business in a staple commodity. This is deleterious. Speculation has kept up the price of copper at its present level. Production is not decreasing. Only an increased consumption can sustain the market.

**The Mining Journal, June 26, 1909.**—The report of a Royal Commission on the centralization of Departments of State in India took up the mining legislation that obtains there. The Mining Journal comments upon the report, and upon some of the statements submitted by witnesses. It appears that the Director of the Geological Survey of India defined the functions of his department as purely advisory. Under six heads he defines the duties that it performs: (a) The preparation of a general geological map of India; (b) the collection and dissemination of information about the mineral resources of the country; (c) the preparation of statistics of mineral production; (d) the control of a geological museum; (e) the teaching of geology in the Presidency College, Calcutta, and (f) the training of a limited number of prospectors and post-graduate students. The Director objects to taking under his wing the granting of mining concessions. He expresses frank distrust of his subordinates. The mining Journal indicates its astonishment at this surprising confession.

**The South African Mining Journal, June 5, 1909.**—Some pertinent remarks on present-day problems are made in this issue.

Absorption and amalgamation of properties on the Rand have brought about new problems. Small mines, equipped for small tonnages, require remodelling when they become component parts of large concerns. The East Rand Proprietary Mines Company is a case in point. Here several small mines were amalgamated under one management. Consequently its working costs are higher than for single large mines of similar total tonnage capacity.

One of the chief problems in operating a group of small properties is the arrangement of the shafts. These are often not capable of dealing with the increased tonnage which is usually the object of the consolidation of properties. Another problem is the sorting of ore from wide stopes that make a large amount of waste. Theoretically, 50 per cent. is the limit of hand-sorting. In practice about 15 per cent. is the average amount of surface sorting done, and 33 per cent. is the maximum. Thirty per cent. appears to be the highest amount that can be economically sorted. The results of the stope drill contest will modify this question.

**The Mining World, July 3, 1909.**—This Special Mexican Edition of our Chicago contemporary is filled with facts, figures, and descriptions of Mexican mining. In several of the editorials there is important information. Concerning the smelter situation in Mexico, it is noted that owing to the extended use of cyanide, a scarcity of siliceous ores for smelting is becoming pronounced. At Guanajuato the cyanidation of concentrates is being

tried out. The proposed nationalization of the smelters is not taken seriously by the Mining World.

There is no zinc smelter in the republic. The spelter used is imported, and pays a large duty, except when in the form of perforated sheets for use in cyanidation. There is no export duty on zinc ore, and when it contains less than 250 grams of silver per ton the export tax on silver is not assessed. Promising zinc ore deposits have been opened up in Jalisco, Sinaloa, and Sonora, tributary to Pacific ports, and available for the European market. Most of this is sulphide ore.

Thirty-seven Mexican mining companies to date have paid to shareholders \$58,307,432 in dividends, a return equivalent to 66 per cent. on their outstanding capitalization of \$89,100,662. By far the larger dividends are being distributed by corporations that are still doing business under the old Mexican custom of capitalizing at so many shares, not dollars, their par value depending upon the demand for the stock in the open market.

On the precious metals there is in Mexico a federal tax of 2 per cent. on the output. There is no federal export tax or direct tax on the base metals, but there are numerous fees and stamps, which are in effect a tax on the base metals exported. The states taxes vary, and include direct taxes on the gross output, percentage taxes on the salary and wage roll, and tonnage taxes on ore mined and ore treated. The stamp tax is ever present.

We could multiply interesting notes from this Mexican edition indefinitely. It is a creditable issue.

We notice with pain that in one editorial the word "data" is used as a singular noun.

## PERSONAL AND GENERAL.

Mr. L. B. Orchard has been appointed chemist to the Atikokan Iron Company, Port Arthur, Ont.

Messrs. R. E. Harris and Thomas Cantley, of the Nova Scotia Steel Company, sailed on June 25 for England.

Mr. Samuel Cohen, general manager of the Crown Reserve, Cobalt, recently underwent an operation in Montreal. He has recovered completely.

Dr. C. W. Dickson has resigned the position of assistant professor of chemistry at the School of Mining, Kingston, and is making arrangements to settle in British Columbia.

Mr. Martin Cohn, managing director of the German Development Company, has returned to Toronto from a visit to Quebec. Late in June Mr. Cohn made a record-breaking return trip to Europe.

Mr. P. N. Nissen, of Los Angeles, is to spend this summer in Ontario. Mr. Nissen is the inventor of the Nissen stamp mill. At the enormous mill of the Boston Consolidated 312 of these stamps are installed. Two trial stamps are to be placed in the mill of the Northern Customs Concentration Company, Cobalt.

Mr. William Maxwell has resigned his position as manager of the Dominion Coal Company's No. 12 mine, which he has held since the early stages of its development, and has taken a position in the Pincher Creek District, Alberta, where a new coal property is being opened up under the direction of Mr. Charles Fergie.

## SPECIAL CORRESPONDENCE

### NOVA SCOTIA.

**Glance Bay, July 5.—June Tonnages.**—The month of June was the briskest that has been seen around the collieries of Cape Breton for a long time past. The men have worked steadily, shipping has been regular, and outputs have in consequence been unusually large.

The mines of the Nova Scotia Steel Co. produced in the neighborhood of 78,000 tons which is some 7,000 tons more than the best preceding output, and is 21,000 tons greater than the output of June last year.

At Glance Bay likewise outputs were good. The mines of the Dominion Coal Company raised 355,000 tons, which is the largest June output ever obtained by that company, and the highest output on record, with the single exception of last July, when 368,000 tons were obtained. The outputs for the half year ending June 30th totalled 1,629,000 tons, showing a reduction of 300,000 tons in comparison with the corresponding period of 1908.

Some notable figures were made by the individual collieries. Dominion No. 1 had an output of 58,000 tons, which is the highest monthly production since the 1903 fire, and approaches the record of this mine before the fire. On one occasion during the month the daily output reached 2,600 tons, which is really an astonishing output from this old colliery.

Dominion No. 2 has 70,400 tons to its credit for the month, which establishes a new record for this mine. On several occasions during June the daily output was over 3,100 tons.

The Hub Colliery (Dominion No. 7) also made a very fine showing, raising 20,600 tons, this being the largest tonnage for a month that the Hub ever put out, in all its numerous vicissitudes.

Throughout the month the outputs showed a remarkable uniformity, practically unmarked by the fluctuations that occur after paydays. This was to some extent accounted for by the dates on which wages were paid, and also by the evident desire of the workmen to provide for possible trouble ahead.

The Nova Scotia Steel Company have now got their rescue station into operation, and gangs of men have been practising in the smoke-chamber. Mr. Robert Robson, a gentleman whose mining experience in Cape Breton reaches back to the days of the General Mining Association, is in charge of the station, and he spent several days at the rescue station at Glance Bay, in order to obtain hints from the experience which the Dominion Coal Company have had in this work. The equipment of the Nova Scotia comprises twelve of the latest model Draeger apparatus, and a corresponding number of the "Tankersley" electric hand-lamps. We think the N. S. S. Company are to be heartily commended for this addition to their equipment, and it is to be hoped that the example set by the two largest coal companies in the Dominion will be followed by others.

An interesting note is contained in one of the papers recently read before the American Institution of Mining Engineers, describing the operations of the Stag Canyon Fuel Company, whose mines are situated near Dawson City, New Mexico, from which it appears that the rescue station of this company is designed after that of the Dominion Coal Company at Glance Bay, with some few modifications. Dr. James Douglas is the president of this company, and judging from the description of the Stag Canyon Company's mine, he is to be congratulated on the provision that has been made for the safety of the workmen, and their personal comfort in such matters as housing and recreation.

The U. M. W. A. in Glace Bay now has its own newspaper organ, a weekly newspaper known as the "Standard." This paper in its first issue, with that characteristic modesty which distinguishes the U. M. W. A., stated that its mission in Glace Bay was to "raise the status of the local press." Some of the items we have noticed in the "Standard" do not, however, bear the impress of the fair-mindedness that we should expect from the editorial chair of a newspaper with such a sense of its high mission to the public. For example, in the last issue we read that the Dominion Coal Company are wantonly destroying two coal seams in their Glace Bay coal field by working the Phalen Seam. Above the Phalen Seam, at a distance of 115 feet, is to be found the Back Pit Seam, 2 feet 7 inches in thickness. Above the Back Pit at a further distance of 73 feet, is the Boutillier Seam, said to be 3 feet 9 inches thick. Separated from the Boutillier by 243 feet of strata is the Harbour Seam, 5 feet 6 inches thick. The "Standard" says that when pillars are drawn in the Phalen the roof falls up to the Back Pit, destroying the same. This is interesting information indeed. A "fall" 115 feet high would be an unhealthy place to work around. The "Standard" goes on to blame the deputy inspectors for dereliction of their duty in allowing this to go on, and the Government for alienating the "people's property" to a corporation that is so wicked as to destroy its own lease value. A little knowledge is a dangerous thing, and is apt to lead the eager newspaper scribe into mistatements of a particularly glaring kind.

The Royal Commission on Coal Supplies which sat some years ago in England and went thoroughly into every phase of coal mining, particularly investigated the effect on coal seams produced by the order in which they were worked, and their conclusions may be taken as the last word on this question, for the witnesses that gave evidence before the Commission were men whose knowledge of coal mining was beyond cavil. The witnesses were unanimous in one statement, namely, that the best seam was always worked first. They all agreed also that the order of working must be decided by the peculiarities of the district, but in general the best way was to take the lower seam first. The effect of working an upper seam was to "wind" or render lifeless the seam immediately below. In such a case it was necessary to decide which seam it would be more profitable to allow to suffer injury. In the Glace Bay coalfield the Back Pit Seam is not a seam that can be commercially worked in the present state of the coal trade, as it is thin, uncertain, and dirty. It was stated in the evidence before the Commission that if the distance between seams was over 100 feet there was no danger of the falls communicating from seam to seam, and that if a sufficient time is allowed to elapse after the exhaustion of the lower seam the upper seam can be mined without any appreciable loss, except a somewhat smaller proportion of round coal. In the case of the two inferior seams lying between the Harbour and Phalen Seams in the Glace Bay coalfield the Dominion Coal Company are following the most approved method of extracting coal seams where the strata contains several coal seams of varying value overlying one another. This method has been approved and passed upon by three at least of the most eminent mining engineers alive, under which circumstances the editorial criticisms of the "Standard" are not likely to carry much weight. We would not have noticed the paragraph but for the fact that many of the readers of the "Standard" may gather an erroneous idea, which should be corrected. It may not be out of place to enquire whether these same readers would prefer to draw pillars in the Phalen Seam, which is 8 feet 6 inches high, or in the Back Pit in 2 feet 7 inches of head room.

**U.M.W.A.-itis.**—After Mr. Tom Lewis's departure to his own country there was a hush in the U. M. W. A. campaign, but we are now given to understand that it was a "sultry hush," and but the prelude to Armageddon. For a year past the motto of the U. M. W. A. leaders in Cape Breton seems to have been that of the Spaniard, "manana," "to-morrow, to-morrow." Since

January there has been a rustling in the tops of the mulberry trees, and now we understand the day of reckoning is at hand. But we have heard this so often. The downfall of the coal barons was fixed for May 1st, a date beloved of the red flag, but something went wrong with the programme. Nothing has even yet been heard of what took place at the convention of May st. The public were then informed that President Lewis himself would visit Nova Scotia and teach the coal companies the egregious error of their ways. Mr. Lewis came, said a few honeyed words, and went. Now the U. M. W. A. clans have foregathered at Sydney, and are in session at the time of writing. They magnanimously invited the coal operators of Nova Scotia to meet them at Sydney and talk the matter over, saying that they, the U. M. W. A., wished to arrive at a satisfactory understanding. Unfortunately, the views of the coal operators and of the U. M. W. A. as to what constitutes a satisfactory understanding do not coincide, and never will. The ideal of the U. M. W. A. as preached to the listening faithful is said to be the simultaneous presence of the legs of a coal operator opposite and contiguous to the legs of a U. M. W. A. delegate, under the same table. However, that may be, the meeting of July 2nd, for which the invitations were issued, did not measure up to this ideal; the letter of the U. M. W. A. was most cordially ignored, and the coal owners were rude enough not even to notice the r.s.v.p.

The district president of the U. M. W. A. has now issued a statement to the press, in which he states that if the Dominion Coal Company do not agree to meet the Executive of the U. M. W. A. by 2 p.m. (Atlantic standard time), June 5th, A.D. 1909, the U. M. W. A. will call a strike on the following morning for higher wages, shorter hours, better conditions generally, and recognition. The Dominion Coal Company will not meet the U. M. W. A., will not recognize them, will not give shorter hours, higher wages, or alter any of the conditions of the present agreement with its workmen, arranged by a Board of Conciliation with the Provincial Workmen's Association, and effective until the end of 1909. So it is up to the U. M. W. A.

There is a law on the statute books of this Dominion known as the Industrial Disputes Act of 1907, and better known as the Lemieux Act, which states that no person shall strike for any change in wages or hours without giving 30 days' notice of his intention to do so, and reference to a Board of Investigation and Conciliation. This law is a sort of ratchet arrangement, and works one way only. At least that is how it looks to the casual observer. We do not remember to have seen its provisions and penalties carried out, although they have been violated times innumerable. It looks as if an opportunity would arrive for testing the impartiality of this law. What is sauce for the goose is sauce for the gander, and what applies to the Dominion Coal Company should also apply to the U. M. W. A. We shall see.

The U. M. W. A. at Springhill have served demands upon the Cumberland Coal Company of such a nature that we think the bare recitation of them will suffice.

First and foremost, the U. M. W. A. ask for "complete recognition, and collection of all dues and assessments through the colliery office." Riding rakes are to be put on half an hour earlier in the afternoon than has hitherto been the custom, and the "Managing Committee of the U. M. W. A. are to be allowed to ride out on the first rake." The list of rates demanded is much too long to quote even in part, but some idea of what it means may be conveyed by the following: Skilled shiftmen are to be paid \$3.05 per day, unskilled shiftmen in charge of gangs \$2.13, and all other unskilled labor \$1.83 per day. All overtime and Sundays to be paid at double-time rate. Any man called out in the night time or working out of his regular shift is to be paid double time. All miners out of places are to be paid wages equal to those which they would earn in places, and if for any reason the regulation wage is not made by a miner he is to be made up to that figure. All coal dropped on the roads or cleaned up in the general opera-

tions is to be credited to the checkweighman's tally, and go to help to pay his wages.

The above are but a few of the requests made to the Cumberland Coal Co. The actual document is a lengthy one, and with a modesty in keeping with their demands the U. M. W. A. have appended to the schedule of demands an agreement all ready drawn for signature, the place of signature of the officers of the Cumberland Coal Company being placed below those of the U. M. W. A.

This is typical of the generally inverted notions of the U. M. W. A., and we think the leaders of this movement must be afflicted with a severe form of either megalomania or megaloccephaly. They talk and act like characters in a Gilbert and Sullivan opera, and they have gasconaded and caracoled before a long-suffering public until their antics and vaporings have ceased even to be amusing, and people are getting most decidedly bored by these disturbers of the public weal.

In pleasant contrast to the rhodomontade of the U. M. W. A. is the attitude of the P. W. A. This organization has preserved a very discreet attitude during the agitation, so discreet, in fact, that its enemies and sometimes too-eager friends have mistaken it for pusillanimity. Mr. John Moffatt, the secretary of this union, now states that all the members of the P. W. A. will continue to work in the event of a strike. Resolutions to this effect were passed at a joint meeting from 13 lodges of the P. W. A., including men from the shipping piers, and the officers of the P. W. A. claim they were never more thoroughly organized. They say the agitation has weeded out the disaffected members and left behind men who can be trusted to stick together.

The Dominion Coal Company appears to have been selected by the U. M. W. A. as their main objective, and it is claimed the whole of the funds of the organization and all its power will be concentrated upon this one corporation. The other operators presumably have no objection to having the Dominion Coal Company set in the forefront of battle, but the fight is theirs also. The Dominion Coal Company will not be found unready, and they will afford all necessary protection to the men who continue at work. If the preparations that they have made savor too much of industrial warfare as it is in the United States, the public know who are to blame. The Dominion Coal Company have been incorporated sixteen years, and until the U. M. W. A. introduced itself they never had a colliery fence, or a police force, or a strike. All grievances have been discussed between the men and the officials of the company in a fair and friendly way, and the general manager of the company was always accessible as a court of appeal from the decisions of his subordinates through the medium of a committee. Are we to believe that the whole of this province groaned in darkness until the U. M. W. A. came to set them free?

If the U. M. W. A. strike, they will do so in face of the award of the Board of Conciliation which they themselves asked for, in face of the fact that the P. W. A. or the majority of the workmen will remain at work, with no grievances to adjust, except the withholding of recognition; and (if the International Board of the U. M. W. A. do as it is claimed they will do) will strike with the aid of money contributed by men whose prosperity depends to a large extent on the wresting of the Canadian market from our own miners, living under a foreign flag, and the agitation will be carried on by alien and professional "walking delegates" and men who have their own little axes to grind. The little group of men who for purely personal aggrandisement have played with fire may see a conflagration they cannot control, and those ease-loving gentlemen who have carelessly and grandiloquently sowed the wind may reap the whirlwind.

#### ONTARIO.

**Cobalt, July 3.**—A writ has been taken out against the directors of the Crown Reserve Mining Co. as trustees for a block of stock amounting to 231,143 shares, which was turned over to

the directors by the syndicate for the purpose of raising money to carry on the development work at the mine. The action is for the return of the stock to the original syndicate. Accrued dividends are also claimed. The plaintiffs are John Black, Percy Ross, R. W. Garth, A. G. Fowler Ross, W. A. MacKay, and Dr. Herbert Ross. In order to avoid the expenses of a suit, the syndicate is, however, willing to have the block of stock equally divided between its members and the shareholders of the Crown Reserve. This compromise the directors have refused to consider.

The sale of the 830 acres of the mining lands of the Gillies Limit was a fizzle, and the returns were very disappointing, considering the extremely high prices that have been offered at various times. The lack of success is not to be wondered at when the procedure adopted by the government is considered. For two years or more the limit has been prospected under the supervision of government engineers, and during that time no reports have been issued to the public. The short time that elapsed between the publication of the notices and the close of the sale, which was not sufficient to permit of proper prospecting, also had a tendency to make people suspicious. Another important factor has been the failure, so far, of the Provincial Mine. This property is located in the centre of the district that was to be sold. Only 283 acres were disposed of, and the price amounted to \$75,643. The following is a list of the successful tenders, giving the price and the amount of land: H. P. Glidden, for John McMartin, Cobalt, 26.7 acres, for \$10,250; F. M. Connell, Haileybury, 11.7 acres, for \$2,500; Geo. Pratt, Buffalo, N.Y., 18.3 acres, for \$11,000; J. H. Waldman, Toronto, two 20-acre lots, for \$2,025 each; S. D. Maddin, Toronto, 20 acres, for \$2,750, and 15.4 acres for \$2,500; Robt. McKay, Toronto, 19.5 acres, for \$10,500; Boyd Magee, Haileybury, 16 acres, for \$8,558; A. T. Budd, Toronto, 19.86 acres for \$2,500, 19.7 acres for \$2,500, and 20 acres for \$2,500; C. A. Phillips, Parry Sound, 19.8 acres, for \$5,500, and J. G. Ross, Montreal, 20.07 acres, for \$5,100.

Plans and specifications for a new concentrator for the Nova Scotia Mine have been completed, and the cost is estimated at \$100,000. Development at the mine is being pushed in a vigorous manner for the purpose of enlarging the ore reserves sufficiently to warrant its construction. At the present time No. 3 shaft is being remodelled. When finished, it will have two compartments, and will be used for hoisting only. A new hoist with a capacity of 1,000 feet is being installed at this working. The total amount of workings up to date in the mine is 7,000 feet. The lowest level is 240 feet from the surface, and at this depth on No. 2 vein a winze is being sunk. Drifting will commence on the vein as soon as it has reached a depth of 65 feet. When No. 3 shaft is completed the No. 1 vein will be developed. The veins of this mine are low-grade, but wide, and the ore is especially adapted for concentrating. On the lowest level the vein has a width of about 8 feet.

Mr. H. Southworth, formerly engineer for the O'Brien, has been appointed manager of the City of Cobalt, in place of Mr. B. Leason, who resigned a short time ago.

The Coniagas have started work clearing the ground preparatory to the erection of the addition to their mill.

The preliminary surveys for the continuation of the T. & W. O. Railway from Charlton to Gowganda have been completed to a point within five miles of the latter place. The Government engineers are at present making exhaustive inquiries to ascertain the amount of revenue that the road would be likely to produce. No reports have so far been given out, and it is not likely that any decision will be arrived at before the end of August. The estimated cost of the road, which would be about 48 miles long, is about \$2,000,000. The location surveys have already been completed as far as Elk Lake.

In the north cross-cut from the No. 2 shaft of the O'Brien, at the 150-foot level, the No. 3 vein of the La Rose was encountered.

At the point where the vein was cut it shows about seven inches of high-grade ore.

In a raise started from the drift at the 150-foot level of the Badger good values were struck. The vein, which previously had been lean, widened out into five inches of high-grade ore.

At the Kerr Lake Mine a new vein of high-grade silver ore has been discovered. It is claimed to be better than the famous Crown Reserve vein.

The O'Brien Mine will shortly commence to double their output of high-grade ore from the mine. The smelter at Deloro, which is also controlled by Mr. M. J. O'Brien, will also have its capacity doubled this summer.

One of the shafthouses of the Cobalt Lake Mine was destroyed by fire on June 21st.

At the Peterson Lake lease of the Kerry Mine a new vein was discovered recently. The find was made at the 125-foot level, about 80 feet from the shaft. Previous development had failed to show the presence of silver in this vein.

While cross-cutting at the 360-foot level of the Big Pete Mine in order to tap a vein located some time ago by the diamond drill, a new vein carrying high silver values was struck at a point about 40 feet distant from where they expect to encounter the other mine. The vein was found in the Huronian slates, underlying the diabase. The finding of these slates, in which the best values of the mine occur, has had an important bearing on the development of the surrounding properties. It is understood that later developments have shown the presence of Keewatin underlying the Huronian slates.

The plant of the Beaver, which was destroyed by fire some time ago, is being rebuilt. Operations will be undertaken on a much larger scale when the mine is in a position to furnish its own power.

The directors of the Silver Cross Mine have decided to increase the capital from \$500,000 to \$1,000,000, and the by-law has been passed allowing them to sell the issue at 10 cents per share. There was a good deal of opposition to the increased capital, and a very stormy meeting resulted.

It is understood that a new 6-inch vein carrying good values has been discovered on the 75-foot level of the Otisse. The wall rock is also said to be well mineralized.

The remainder of the 830 acres of the Gillies Limit mining lands which were unsold under the recent tenders will be again offered for public sale on July 13th.

The Union Pacific, which is operating a lease on Peterson Lake, will shortly install a small steam plant, consisting of a 6x8 hoist and a 25-horsepower boiler. Drills will not be used until the power companies have air ready for distribution. The shaft will be sunk to greater depth before cross-cutting of the vein is started.

At the Temiskaming a winze has been sunk 50 feet below the 250-foot level on No. 4 vein, and from the bottom a drift was driven to the vein. When the drift was in about 15 feet the vein widened to about 7 inches of high-grade ore. A cross-cut is also being driven from the bottom of the winze to tap No. 7 vein.

It is understood that the Trethewey will shortly commence sinking a shaft in the northeast corner of the property. The Temiskaming & Hudson Bay have been operating a drill in this section from the 150-foot level of their shaft for the Trethewey, and it is with these workings that the shaft will connect.

Mr. A. P. Seymour has resigned his position as manager of the Floyd Mine.

Formal application has been filed in the office of the Provincial Secretary at Toronto for permission to increase the capital of the Temiskaming & Hudson Bay Company to \$3,500,000.

The diamond drilling at the City of Cobalt Mine has been stopped, and it is understood that satisfactory results were

obtained. Drilling was started from the bottom of the shaft, and when a depth of about 550 feet from the surface was reached, the Keewatin, in which the hole was started, was found to give place to the diabase. The discovery of this rock underlying the Keewatin is of great importance.

Diamond drill cores have lately been the means of giving a great deal of information regarding the different formations. A short time ago the diamond drill that was working on the Foster located the Huronian slates underlying the Keewatin. As the drilling progressed, however, the Keewatin was found to come in again below the slates.

A new find has been made on the Rawhide property located near Miller Lake. The vein consists of aplite, carrying good silver values.

The Gifford Extension has made arrangements to buy air from the Ophir, and the pipe line is now being laid.

The buildings of the Badger Mine were almost totally destroyed by fire. They caught from the bush fires in the vicinity, which also menaced the buildings of several of the surrounding mines.

### BRITISH COLUMBIA.

**Rossland.**—The management of the Le Roi Mining Company have intimated that the company has been successful in the raising of money with which to carry out the plan of development work that it is deemed advisable to do in the Le Roi mine. One of the chief features of the work, that will very likely be started early in July, will be a thorough exploration of what is considered the richest and most likely part of the Le Roi ground, from the present bottom of the mine, the 1,650-foot level, to the 2,560-foot level. The preliminary part of this work will (if plans already discussed are used) be done with diamond drill, holes being put into the ore-bearing ground from the 1,650-foot level downward, at intervals of about 100 feet in depth and about 200 feet apart on the vein. Comparatively rich ore has been found on the 1,650-foot level of the Le Roi; it occurs, however, in lenticular deposits in ground that is badly broken up, so that a broad plan of exploration seems to be the most advisable and what would prove the most economical in the long run, as sinking, drifting, etc., is expensive in the hard diorite of this locality.

During the week ending June 19th the output of the Centre Star group climbed to the 4,350-ton mark, which is 500 or 600 tons over what that property has been averaging during the last few months. During the same week other properties of the Consolidated Company shipped ore to the company's smelter at Trail as follows: St. Eugene, 601 tons; Snowshoe, 3,880; while the last shipment from the Richmond-Eureka amounted to 202 tons.

The Le Roi 2, Ltd., maintains a steady weekly production of approximately 420 tons, and mills about 250 tons of second-class ore. Le Roi 2 ore is the best that is shipped from this camp in the way of copper ore, but there is a very narrow margin of profit in milling operations here. The Blue Bird sent out ten tons of hand-picked ore during the past week. This ore comes from the galena-bearing reef in the South Belt, and gives returns of nearly \$80 per ton when carefully selected.

The metallic production of the Trail smelter during May was \$300,000 of gold, silver, \$250,000; copper, \$65,000; lead, \$175,000; a total of \$790,000. The production of this plant for the present year will be a couple of million dollars more than during 1908.

**Boundary.**—Mr. P. F. Roosa, erstwhile receiver for the Dominion Copper Co., has been appointed manager of the New Dominion Copper Co., now that the new concern has taken over the recently acquired interests of the defunct corporation. It is thought the mines will be opened up again early in August. The

New Dominion Copper Co. starts off in pretty good form, and it is to be hoped that this venture will prove a profitable one to the men who have their capital in the enterprise.

A small force of men have been put to work clearing up about the Sunset mine, getting things ready for the resumption of work. There is some talk of work being taken up again at the Providence mine, Greenwood. Over 700 tons of high-grade ore was shipped from this property in 1907, while only 50 tons was taken out last year, the energy of the directors being mainly centered on the placing of the company's bond issue.

As the coal miners in the Alberta fields have rejected the agreement of the Arbitration Committee, there is still no hope of coke from Coleman, whence the B. C. Copper Co. derives its supply. It is stated that this company during the last month that it worked was able to lay its copper product down in New York City for a fraction of less than eight cents per pound. It is hardly to be expected, however, that this figure could be maintained month in and month out, particularly when all fixed charges have been included. The B. C. Copper and Granby Companies, however, are in a position to make copper nearly as cheaply as any copper mining company on the continent, with a few exceptions, where quarrying is extensively carried on. The ore bodies are quite large in the Boundary, so that thousands of tons of the low-grade ore can be broken at a time, and, once broken, it is handled as much as possible by gravity, automatic loading, electric underground railways, gigantic crushers, etc., while at the smelters the ore, coke, etc., are all handled by automatic or nearly automatic machinery.

The tramway on the Phoenix-Amalgamated has nearly been completed to the railway siding. As soon as things have been arranged at this mine the Consolidated Company intends to ship ore from it to the Trail smelter.

**Nelson.**—The Eva mine, at Camborne, has been bonded by Eastern capitalists. The mine is very well equipped with machinery for present needs, there being a modern air compressing and power plant on the ground, as well as a 10-stamp mill and concentrator. In the Eva mine there is a large tonnage of gold ore that runs on an average low-grade, although there are veins in the large lodes that carry good quantities of the precious metal. Work on the "glory hole" plan has been carried on at some of the big surface lodes with good results. The mill was put in four or five years ago, and was worked steadily up to twelve or fourteen months ago, when it was decided by the management to sell the property. During the time that the mill was operated about \$250,000 in gold was taken from the ore treated.

There is no doubt but that the Slocan lead-zinc district is a factor, and a not unimportant one, in the tariff war being waged at Washington, D.C. This has been more particularly evinced by the presence in this district during the past week of J. A. Ede, of the Illinois Zinc Company, who is studying the local situation. The general manager of this concern, Mr. T. F. Noon, is in the capital city fighting on the side of those who are against too much protection for the zinc industry. There are big bodies of

zinc ore (the Mammoth group on Arrow Lake, for instance) that the American zinc companies would buy and work if the tariff wall was taken down. This state of affairs may be to the best interests of Canadian capitalists, however, who are bound to work these big zinc mines when the Canadian market grows to a point that will warrant such action, which it is drawing nearer to from year to year.

An \$8,000 gold brick was realized at the clean-up made at the Nugget mill last week. This was the result of a twenty-day run.

The fifth annual report of the International Coal & Coke Co. shows that the net profits on the operations of the company for the past fiscal year were \$284,210. This company recently sold 200,000 shares of its treasury stock to Victoria men, the proceeds of which will go toward paying off the bonded indebtedness. The International Company is about as well equipped for the mining of coal and the manufacture of coke economically as any company in the Crow's Nest-Alberta field, and with continued good management will prove a moneymaker for those who have invested their capital in the enterprise.

The Highland mine at Ainsworth is under bond, and it is understood will be worked early this summer.

The president of the B. C. Mining & Development syndicate, Dr. G. A. Ullerick, of Chicago, is in the district looking over the property of the company, comprising six gold-copper claims on the St. Mary River. A meeting of the Board of Directors was held while Dr. Ullerick was here, the engineer's report on the claims was read, and plans for working the claims at an early date were discussed.

The Head-Martin coal lands, which adjoin the property of the International Coal & Coke Co., will soon be under active development, a company known as the Head Syndicate having been formed with a substantial capital, part of which is now available for the proposed work. Leslie Hill, of Nelson, has been appointed consulting engineer and manager.

**Vancouver.**—Recently the interests of the Stave Lake Power Co. were taken over by the Western Canada Power Co., a new five-million-dollar corporation, the management of which expect within eighteen months to be able to deliver all or any part of 30,000 electrical horsepower to the cities of Vancouver and New Westminster, that power to be derived from the force of Stave River. A crew of sixty men is now employed in the construction of dam and plant, but this force is to be immediately augmented in order that the work will be finished at the time that has been set for its completion.

Continued activity is the watchword of the Portland Canal Mining Co., of which Mr. C. H. Dickie, of Victoria, is president. The extension of two of the tunnels on the property is being prosecuted with all possible speed, and a new tunnel has been started toward the ore-bearing ground. The towers are nearly finished that will carry the aerial tramway, and the concentrator site has been cleared and the foundation built in. The work will be hurried as much as is possible, in order that shipments can be started early this fall.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Sydney.**—The Dominion Coal Company has made a formal demand upon the Dominion Iron & Steel Company for a readjustment of the price of coal.

The coal contract between the Dominion Coal Company and the Dominion Iron & Steel Company, which was made on October 20th, 1903, provides that coal should be supplied till June 30th, 1909, at the price of \$1.24 per ton.

The contract then provides that on and after June 30th, 1909,

either party may require a readjustment, and if no agreement can be arrived at between them, the prize shall be settled by arbitration.

The new price is to be determined by taking the average cost of mining and delivering the coal for the five years ending June 30th, 1904, and also for the five years ending June 30th, 1909, and as the average cost for the first period is to the average cost for the second period, so will \$1.24 per ton be to the new price for the period from June 30th, 1909, to June 30th, 1914.

It is understood that no arbitrators have yet been appointed, and that the arbitration proceedings will not be proceeded with until the return of President Plummer from England.

### QUEBEC.

It is understood that the capital of the new asbestos merger, the Black Lake Consolidated Asbestos Company, will be \$1,000,000 6 per cent. bonds, \$1,000,000 7 per cent. non-cumulative preferred stock, and \$3,000,000 common stock. The company will take over the Union Asbestos mines, Southwark mines, the controlling interest in the Imperial Asbestos Company, and the Black Lake Chrome & Asbestos Company—in all an acreage of 5,385.

### ONTARIO.

**Elk Lake.**—A 40-inch vein was cut at the Otisse mine on July 1st.

**Cobalt.**—The fire that visited Cobalt on July 2nd did not do as much damage as currently reported. One thing is to be placed to its credit—it gave the town an opportunity of building regularly; \$350,000 will more than cover the entire loss.

**Dryden.**—The Northern Pyrites Co., operating on the shores of Vermilion Lake, near Lake Superior Junction, is about to commence shipping ore.

**Fort William.**—Several former Cobalt men, including N. G. Trethewey, have passed through Fort William on their way to the Sturgeon Lake gold fields. The Grand Trunk Pacific has now a direct train service from Fort William to Sturgeon Lake. On the lake, steamer connection may be had to any point on the shore.

**Port Arthur.**—The Atikokan blast furnace will very soon be blown in. A successful campaign will do much for the town. Mr. J. Dix Fraser, general manager, is a most competent man.

### BRITISH COLUMBIA.

**Vancouver, June 28.**—Greenwood Miners' Union, No. 22, Western Federation of Miners, has declared a strike against the mines and smelter of the British Columbia Copper Co. for the recognition of Greenwood Miners' Union. This is the substance of the circular issued by the Greenwood union. The manager of the British Columbia Copper Co. states that he has received no notification of the strike. The company is not operating at present through lack of coke.

**Rossland.**—The results obtained recently from the workings of the Blue Bird and the Hattie Brown mines in the South Belt are most favourable. The lessees of the Blue Bird took a car-load of ore out of the new ledge that netted them \$2,400.

**Fernie.**—The Crow's Nest Pass Coal Company has just completed the construction work on a new steel tippie at its mines at Michel, B.C., with a capacity of 1,000 tons of coal per hour. This is probably the largest single tippie on the continent.

**Rossland.**—J. L. Warner, F. M. Black and Dr. F. E. Morrison made the third payment, of \$13,500, on the Kootenay Belle mine at Sheep Creek, owned by Thomas Bennett and H. M. Billings. During the past week the mill returns have averaged \$160 per day.

During the past week an important strike was made on the Golden Belle at Sheep Creek. Two ledges had previously been laid bare and had shown excellent shipping and milling values. A third ledge was, however, discovered, showing about 11 inches of \$100 ore and about 12 inches of \$40 milling ore.

A rich discovery was also reported on the Gold Note, near Eagle Creek, and some magnificent samples of free milling quartz were brought in to the city. The specimens shown were joined together by threads and small veins of pure gold.

It was announced that the reorganized Dominion Copper Company at Greenwood intend to open up their properties in August.

Rossland shareholders in the Le Roi mine have received a circular in which it is stated that the necessary arrangements have been made whereby an extensive scheme of development may be carried on, and that work in connection therewith will commence without delay.

## MINING NEWS OF THE WORLD.

### GREAT BRITAIN.

Ninety-three per cent. of the Scotch coal masters have agreed to stand together for the reduction of the men's wages, and in opposition to a recognized minimum wage of 6s. per day.

The Prince and Princess of Wales on June 11th visited the Phoenix mine, six miles from Liskeard. Here the Prince christened a new shaft, and the Princess started a new pumping engine named after herself. After putting on mining attire, their Royal Highnesses went underground, where they inspected the tin lode and watched the miners at work.

### MEXICO.

One of the most remarkable oil wells ever known probably is that at Dos Bocas, in the northern part of the State of Vera Cruz. The well has been remarkable, not only on account of the fierce conflagration which consumed several million barrels of oil, but also on account of the tremendous force of the flow and the enormous output. Since the extinguishing of the fire the paramount problem has been to control the flow and save the oil. Immense earthen reservoirs and dykes have been built, but the oil has overflowed these and spread over the lagoons for a distance of several miles. In addition to this discouraging predicament, men and animals have succumbed to the effects of the

noxious gases which are constantly being thrown off by the well in great quantities. The company owning the well have worked incessantly and persistently, and now have it under control.

One of the effects of the development in the oil districts of Mexico has been that petroleum has come into use as a substitute for coal as fuel. Formerly the Mexican railways consumed from 120,000 to 140,000 tons of patent fuel drawn from Cardiff and district, but during the latter half of 1908 they converted 50 per cent. of their engines to oil-burners, and so satisfactory and economical has the result been that it is only a matter of the erection of the necessary storage tanks for the use of coal as fuel to be given up altogether. Many industrial enterprises which were formerly coal consumers have changed, and still others are now changing, their boilers in order to use oil. This has affected the importation of coal and patent fuel from the United Kingdom and elsewhere to the extent of causing a decrease in imports of about 40 per cent. during 1908.

### UNITED STATES.

At the experimental plant of the Fink smelter at Salt Lake City a 90 per cent. copper product was made. Later, in the same furnace, blister copper was made.

The retention of unmanufactured asbestos upon the free list is an acknowledgment by Washington legislators that Canada

has other special resources required by American industrial centres. It would be more to the purpose now if the manufacturers of asbestos were also relieved of the 25 per cent. ad valorem imposition, since the action of the Senate is an admission that the Canadian product is an essential.

The 25 per cent. penalty is having the effect of inducing those in the pro-British Continental trade to locate factories in Canada, and the concession made in the tariff bill will enable these to "catch 'em going and coming," as it were. The trend of affairs in the asbestos industry is toward milling stock. If the States will take "the cotton" in increasing quantities, and the first and second crude remain at present prices, the Quebec mines will assume greater importance.

#### CHINA.

The draft agreement with regard to the Anhui mining concession granted to Sir John Lister Kaye on behalf of the London and China Syndicate, Ltd., has been completed, but has not yet been approved by the Chinese Central Government. It necessitates the issuing of 160,000 £1 deferred shares of the An Yu (Yangtze) Concession Company, Ltd., at par, for Chinese subscription. These shares are now being offered to the leading merchants in the Anhui Province. The main idea of the agreement is Anglo-Chinese co-operation in the development of the Tung Kwan Shan mines, with British control of the finance. Hopes of an early settlement are entertained.

#### AUSTRALIA.

The first shipment of refined copper from New South Wales was made in May by the Electrolytic Company from Port Kemble. It consisted of 280 tons of copper wire bars.

At the Great Boulder Perseverance mine, Kalgoorlie, West Australia, telluride gold ores were discovered last October at a depth of 1,750 feet. The ore at that level assayed 100 dwts. per ton. A winze sunk to a further depth of 116 feet showed up ore carrying 42 dwts. per ton. This winze is to be sunk to the

1,900-foot level. At this depth there is 6 feet of ore in the drift assaying 8 dwts. per ton.

The Great Fingall Consolidated, Western Australia, has done away with its old filter system for treating slimes, and has installed a vacuum process. The new plant treats 10,000 tons per month, with 2 shillings profit per ton.

The shrinkage of 4,600 in the number of native mine labourers during May is explained as being always a concomitant of cold weather. Recruiting in Central Africa is progressing rapidly.

#### SOUTH AFRICA.

The Transvaal Government has agreed to issue 3,000 passes to enable the mining industry to enlist natives from the Central African Protectorate for work on the mines.

The developments on Waterbury tin prospects are most encouraging. In the Lydenburg district the sandstone reefs are opening up well on many properties.

Eight monitors will be working by September in the Swaziland tin fields. The deposits worked give a return of 15 per cent. metallic tin.

#### SOUTH AFRICA.

The East Rand Gold and Coal Estate have located the reef in their fresh borings on the farm Vischnil, adjoining one of the East Rand Mining Estates.

The commission appointed to inquire into the various electrical power schemes in their relation to Rand mining is now sitting. One witness stated that the utilization of electric power on the City Deep would result in a saving of £124,000 per annum. No new power scheme will be authorized until the commission has reported.

Further substantial tin discoveries have been made in the Waterberg district.

The June gold output, allowances being made for the transferred reserves appearing in the December figure, actually constitute a record.

## COMPANY NOTES.

#### BUFFALO MINES SURPLUS.

The Buffalo Mines, Limited, reports for the year ending April 30, 1909:—

|                    |           |
|--------------------|-----------|
| Total income ..... | \$479,483 |
| Expenses .....     | 275,193   |
| Surplus .....      | \$204,290 |

The general balance sheet shows a profit and loss credit of \$183,834, out of which was declared a dividend of 3 per cent., payable May 5 last.

The statement of operations for the first complete year of the new La Rose Company's existence, from June 1st, 1908, to May 31st, 1909, has just been issued.

The statement shows that the net operating profit is equivalent to 19½ per cent. on the outstanding capital prior to the distribution of the Lawson stock. The amount of ore taken out has been practically replaced by the addition of ore reserves in the main and other veins of the La Rose proper. With the transfer of the Lawson mine the whole of the company's capital of \$7,500,000 is now practically all issued, with the exception of a few shares not yet taken up by University holders.

The following are the official figures for the fiscal period:—

| Shipments.                                        | Tons.    | Oz. silver.  | Net value.<br>at mine. |
|---------------------------------------------------|----------|--------------|------------------------|
| June-December, 1908 .....                         | 325,777  | 1,498,592    | \$671,286              |
| January, 1909 .....                               | 58,145   | 291,349      | 132,598                |
| February, 1909 .....                              | 50,280   | 220,938      | 99,237                 |
| March, 1909 .....                                 | 49,281   | 131,345      | 55,188                 |
| April, 1909 .....                                 | 64,984   | 309,944      | 137,128                |
| May, 1909 .....                                   | 56,956   | 496,004      | 226,043                |
| Total shipments .....                             | 6,054.23 | 2,948,172    | \$1,321,480            |
| On hand May 31, 1909.....                         | 109,198  | 89,657       | 42,892                 |
| Total production .....                            | 6,163.43 | 3,037,829    | \$1,364,372            |
| Sundry income (interest and ground rentals) ..... |          |              | 1,518                  |
|                                                   |          |              | \$1,575,497            |
| Marketing expenses .....                          |          | \$203,231.19 |                        |
| Concentrating .....                               |          | 6,375.20     |                        |
| Operating expenses at mine .....                  |          | 272,318.67   |                        |
|                                                   |          |              | 481,925                |
| Net operation profit for one year .....           |          |              | \$1,093,572            |
| Construction accounts .....                       |          |              | 23,574                 |

The Temiskaming & Hudson Bay Company, of Cobalt, has declared a dividend of \$3 a share, or 300 per cent., on the capital issued.

Up to date the company has distributed 13,600 per cent. in dividends, the payment being as follows:—

| Date.                 | P.C.   | Amount.   |
|-----------------------|--------|-----------|
| November, 1906 .....  | 200    | \$15,552  |
| October, 1906 .....   | 2,500  | 94,025    |
| November, 1906 .....  | 6,500  | 504,465   |
| July, 1907 .....      | 300    | 23,283    |
| February, 1908 .....  | 200    | 15,522    |
| March, 1908 .....     | 200    | 15,522    |
| June, 1908 .....      | 400    | 31,044    |
| July, 1908 .....      | 600    | 46,566    |
| August, 1908 .....    | 1,200  | 93,132    |
| September, 1908 ..... | 300    | 23,283    |
| November, 1908 .....  | 300    | 23,283    |
| December, 1908 .....  | 300    | 23,283    |
| February, 1909 .....  | 300    | 23,283    |
| June, 1909 .....      | 300    | 23,283    |
| Total . . . . .       | 13,600 | \$955,526 |

The annual report of the Buffalo Mines, Limited, shows a production of approximately 1,000,000 ounces of silver marketed during the past year, a very creditable showing, particularly in view of the fact that for the first half of the year the policy of the management was one of simply maintaining the former dividend of 12 per cent. per annum.

During the last half of the year the policy was changed to one of heavier production following the increase in the dividend rate. The production of the last year added to that of the two

preceding years will total about 3,000,000 ounces of silver shipped to date. The management have decided upon a production of 2,000,000 ounces during the next year, which will mean doubling the rate of production of the three past years.

The Buffalo mine was among the first to begin the installation of a concentrating mill to treat the low-grade ores. As experiments had to be made, time was required in the installation first and in experimenting afterwards, but their untiring efforts were rewarded at last. The mill is treating at present upwards of 100 tons per day. The annual report shows that the mill has been saving 86.4 per cent. of the values. The mill rock averaged 43 ounces silver, the concentrates 1,500 ounces silver, and the high-grade ore 3,000 ounces silver. Nothing but high-grade ore and concentrates is being shipped, and a large saving is being effected over the old method of shipping all grades.

During the present month a crushing plant will be installed at a depth of 75 feet in No. 6 shaft for the purpose of adding to the capacity of the plant. By this means the crushing facilities will be doubled and the mill rock will be all the more easily handled after being hoisted. A complete cyanide plant has been installed, and will be started this month.

A new feature about the Buffalo Company, and one most commendable, is a decision to issue a monthly report to the stockholders. This will be sent out about the middle of each month covering the operations of the past month, and will embrace among other details the cost of operating, number of men employed, work accomplished in each department, number of tons of ore hoisted, amount of high-grade shipped, concentrates shipped, and the value of the shipments. The mill report will include the number of days the mill ran, quantity of ore milled, total ounces of silver recovered, and the mine report will show the number of tons of ore broken and the quantity of high-grade and mill ore blocked out.

## STATISTICS AND RETURNS.

The Dominion Coal Company's output for June, 1909, shows a gain of 10,000 tons over same month last year, and a gain of 6,359 tons over May, 1909. The following comparative table shows the last six months' production:—

|                            | 1909.     | 1908.     |
|----------------------------|-----------|-----------|
| January .....              | 195,971   | 312,358   |
| February .....             | 206,970   | 283,358   |
| March .....                | 251,585   | 344,129   |
| April .....                | 241,934   | 303,249   |
| May .....                  | 316,888   | 335,829   |
| June .....                 | 353,247   | 343,313   |
| Total for six months ..... | 1,616,705 | 1,922,236 |

The output of the Dominion Iron and Steel plant for June was largest yet reached, and new high records were made at last furnaces, open hearth, blooming, and rod mills. The principal items of production are:—

|                                      |              |
|--------------------------------------|--------------|
| Pig iron .....                       | 24,260 tons  |
| Steel ingots .....                   | 28,142 tons  |
| Rails .....                          | 18,419 tons  |
| Wire rods .....                      | 7,402 tons   |
| Shipments for month aggregated ..... | 27,000 tons. |

Shipments from the collieries of the Cumberland Railway & Coal Company, Springhill, N.S., for June were 25,801 tons.

### COBALT ORE SHIPMENTS.

Following are the weekly shipments from the Cobalt camp, and those from Jan. 1, 1909, to date:—

|                            | July 3.<br>Ore in lbs. | Since<br>Jan. 1.<br>Ore in lbs. |
|----------------------------|------------------------|---------------------------------|
| Buffalo .....              | .....                  | 613,777                         |
| Chambers-Ferland .....     | 60,000                 | 719,440                         |
| City of Cobalt .....       | .....                  | 874,522                         |
| Cobalt Central .....       | 35,901                 | 398,924                         |
| Coniagas .....             | .....                  | 807,005                         |
| Crown Reserve .....        | 51,380                 | 2,950,664                       |

Ore shipments to July 3, 1909, from Jan. 1, are 30,693,451 lbs., or 15,346 tons. Total shipments for week ending July 3 are 2,032,653 lbs., or 1,016 tons.

**COBALT ORE SHIPMENTS.**

Heavy shipments by the Nipissing last week put that mine ahead of the La Rose for the first time this year as the leading shipper of the Cobalt camp, and also helped to swell the total of the camp's shipments to 1,429,708 pounds of ore for the week, 714 tons, a record.

Shipments for the year to date total 28,433,203 pounds of ore, or 14,216 tons, nearly double the output in the same time last year, when shipments aggregated 17,358,338 pounds, or 8,676 tons.

**B. C. ORE SHIPMENTS.**

The shipments for the week ended June 26 were several thousand tons above the average for the year. The following are the ore shipments for the week and year to date:—

**Boundary Shipments.**

|                 |        |         |
|-----------------|--------|---------|
| Total . . . . . | 22,284 | 531,858 |
|-----------------|--------|---------|

**Rossland Shipments.**

|                 |       |         |
|-----------------|-------|---------|
| Total . . . . . | 5,012 | 116,013 |
|-----------------|-------|---------|

**Slocan Kootenay Shipments.**

|                 |       |        |
|-----------------|-------|--------|
| Total . . . . . | 3,838 | 90,338 |
|-----------------|-------|--------|

Total shipments for the past week were 31,134 tons and for the year to date 738,209 tons.

**Granby Smelter Receipts.****Grand Forks, B.C.**

|                 |        |         |
|-----------------|--------|---------|
| Total . . . . . | 19,760 | 464,608 |
|-----------------|--------|---------|

**Consolidated Co.'s Receipts.****Trail, B.C.**

|                 |       |         |
|-----------------|-------|---------|
| Total . . . . . | 8,259 | 178,037 |
|-----------------|-------|---------|

The total smelter receipts for the past week were 28,019 tons and for the year to date 794,428 tons.

Gold output of the Transvaal mines last month, as estimated by Kaffir houses in London, was 610,000 ounces fine. This estimate indicates a falling off in output from that of May of 14,500 ounces—owing, likely enough, to one day less of operations. Comparison of values is as follows:—

|                          |              |                      |              |
|--------------------------|--------------|----------------------|--------------|
| June, 1909 . . . . .     | \$12,962,000 | June, 1908 . . . . . | \$12,212,000 |
| May, 1909 . . . . .      | 13,263,000   | June, 1907 . . . . . | 10,780,000   |
| April, 1909 . . . . .    | 12,894,000   | June, 1906 . . . . . | 10,709,000   |
| March, 1909 . . . . .    | 12,903,000   | June, 1905 . . . . . | 8,757,000    |
| February, 1909 . . . . . | 12,004,000   | June, 1904 . . . . . | 6,546,000    |

The total output of gold from Rhodesia for the month of May is cabled at 53,467 ozs. valued at £225,032, as against 52,906 ozs. valued at £222,700, in the previous month. This is an increase on the month of £2,332. There were 230 gold producers last month. The output of other minerals for last month was: Silver, 22,116 ozs.; lead, 81 tons; coal, 14,420 tons; copper, 11 tons; chrome ore, 623 tons; asbestos, 33 tons.

**TORONTO MARKETS.**

**Metals, July 8.**—Quotations from Canada Metal Co., Toronto. These prices are slightly higher than wholesale prices obtainable on large orders.

Spelter, 5½ to 5¾ cents per lb.

Lead, 3½ cents per lb.

Antimony, 8½ cents per lb.

Tin, 31 cents per lb.

**Copper—**

Casting, 13¾ cents per lb.

Electrolytic, 13¾ cents per lb.

**Ingot Brass**—10 to 14 cents per lb.

**Pig Iron—July 8.**—(Quotations from Drummond, McCall & Co.)

Summerlee, No. 1, \$22.25 (f.o.b. Toronto).

Summerlee, No. 2, \$21.75 (f.o.b. Toronto).

Midland, No. 1, \$17.75 to \$18.00 (f.o.b. Toronto).

Pig iron prices are stiffening.

**Coal—**

Anthracite, \$5.50 to \$6.75.

Bituminous, \$3.50 to \$4.50 for 1¼ inch lump.

**MARKET REPORTS.****Coke.**

July 8.—Connellsville coke, f.o.b. ovens—

Furnace coke, prompt, \$1.50 to \$1.60 per ton.

Foundry coke, prompt, \$1.80 to \$1.90 per ton.

**Metals.**

July 8.—Tin, straits, 29.125 cents.

Copper, prime lake, 13.40 to 13.50 cents.

Electrolytic copper, 13 to 13.10 cents.

Copper wire, 15 cents.

Lead, 4.35 cents.

Spelter, 5.45 cents.

Sheet zinc, 7.50 cents.

Antimony, Cookson's, 8.375 cents.

Aluminium, 21 to 24 cents.

Nickel, 40 to 47 cents.

Platinum, \$22.50 to \$23.50 per oz.

Bismuth, \$1.75 per lb.

Quicksilver, \$44.50 to \$45 per 75 lb. flask.

**SILVER PRICES.**

# NEW BOOKS on MINING, METALLURGY POWER GENERATION

## Principles of Mining

Valuation—Organization—Administration

Copper, Gold, Lead, Silver, Tin and Zinc

By Herbert C. Hoover, E. M.

200 pages, 6 x 9, illustrated, \$2.50 (10/6) net postpaid  
Published April 1909

## A Manual of Underground Surveying

Loyal Wingate Trumbull, E. M.

Consulting Mining Engineer; formerly Professor of Mining, University of Wyoming; formerly United States Deputy Mineral Surveyor for Colorado

Over 250 pages, 6 x 9, fully illustrated, \$3.00 (12/6) net postpaid

## Mining Methods in Europe

By Lucius W. Mayer

Mining Engineer

170 pages, with many illustrations, \$2.50 (10/6) net, postpaid

This book places the latest information at the disposal of mining engineers and mining men. It is a most valuable piece of work and of the greatest importance to the mining man who seeks more economical and practical methods.

The illustrations from photographs taken in the mines by the author are a striking feature.

## The Study of Ore Deposits for the Practical Miner

With descriptions of Ore Minerals, Rock Minerals and Rocks.

A Guide to the Prospector.

By J. P. Wallace, M.D., E.M.

Member of the American Institute of Mining Engineers, and the Colorado Scientific Society

Over 350 pages, 6 x 9, with over 100 illustrations, cloth \$3.00 (12-6) net  
Leather edition, pocket size, thin paper, \$3.50 (15s) net

## McNeill's Code

(1908 Edition)

\$13.00 net postpaid

This new edition does not contain a single code word appearing in the former edition. It is brand new, with a great many additions and is the best general code offered.

It covers the mining field with the greatest thoroughness and meets all requirements of all business. It is three times as large as the old edition.

The terminal index is embodied in this code.

## Notes on Metallurgical Mill Construction

Edited by Walter Renton Ingalls

256 pages, 6 x 9, cloth, \$2.00 (8/6) net postpaid

A New, One-Volume Edition of

## The Nature of Ore Deposits

By Dr. Richard Beck

Professor of Geology, Mining Academy, Freiberg

Translated and revised by Walter Harvey Weed

Formerly published in two volumes. Now issued in one volume.  
\$6.00 (145s) net postpaid

## Millwrighting

By James F. Hobart, M. E.

400 pages, 6 x 9, fully illustrated, \$3.00 (12/6) net postpaid  
(Published March 1909)

## Notes on Lead and Copper Smelting

Revised to November, 1908

By Hiram W. Hixon

162 pages, 6 x 9, \$3.00 postpaid

## Copper Mines of the World

By Walter Harvey Weed

Price \$4.00

## Principles of Copper Smelting

By Edward Dyer Peters

Price \$5.00

## The Metallurgy of Steel

By Bradley Stoughton

Price \$3.00

## The Manufacture and Properties of Iron and Steel

By Harry Huse Campbell

Price \$5.00

## A Manual of Fire Assaying

By Chas. H. Fulton

Price \$2.00

## Hydrometallurgy of Silver

By Ottokar Hoffman

Price \$4.00

## The Electric Furnace

By Alfred Stansfield

Price \$2.00

## Mining, Mineral and Geological Law

By Chas. H. Shamel

Price \$5.00

## Mine Timbering

By Sanders, Parlee, Macdonald and others

Price \$2.00

## Simple Mine Accounting

By David Wallace

Price \$1.00

## The Gas Engine

By Cecil P. Poole

Price \$1.00

## Gas Power

By F. E. Junge

Price \$5.00

## Producer Gas and Gas Producers

By S. S. Wyer

Price \$4.00

## Tulley's Handbook on Engineering

(Steam and Electrical)

By H. C. Tulley

Price \$3.50

## Motor Troubles

By E. B. Raymond

Price \$1.50

## Steam Turbines

By Lester G. French

Price \$3.00

## The Power Handbooks

Per volume \$1.00. Monographs on the following subjects:

|                 |                  |                               |
|-----------------|------------------|-------------------------------|
| Shaft Governors | Pumps            | Shafting, Pulleys and Belting |
| Erecting Work   | Knocks and Kinks | Engine-Room Chemistry         |
| Boilers         | Pipes and Piping | Steam Turbines                |

## The Copper Handbook, Vol. VIII.

A Manual of the Copper Industry of the World

1,500 pages, 5¼ x 8½, price \$5.00

## Mineral Resources of Canada

140 pages, 7½ x 9½; 32 color engravings; mineral map of Canada

Price: paper \$1.00, cloth \$1.25

## The Dominion Coal Company

An Historical and Descriptive Brochure

By F. W. Gray

Price \$1.00

## IMPORTANT BOOKS IN PREPARATION

Volumes III and IV of

## Ore Dressing

By Robert H. Richards

Professor of Mining, Massachusetts Institute of Technology

2 Vols., 600 pages each, 6 x 9, fully illustrated, per Vol. \$5.00 (21/-) net postpaid

(Scheduled for publication June 1909)

## Timbering and Mining

By W. H. Storms

6 x 9, fully illustrated, \$2.00 (8/6) net postpaid

(Price subject to change. Scheduled for publication June 1909)

## Electro-Magnetic Ore Separation

By C. Godfrey Gunther

6 x 9, fully illustrated, \$3.00 (12/6) net, postpaid

(Scheduled for publication May 1909)

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

**CANADA.—DEPARTMENT OF MINES.****Geological Survey****PUBLICATIONS**

The Geological Survey has published maps and reports dealing with a large part of Canada and with many local areas and special subjects

**MARITIME PROVINCES**

The whole of Cape Breton and a large portion of the coal and gold fields of Nova Scotia have been reported upon and mapped on a scale of 1 mile to 1 inch. The remaining portions of the province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter provinces, mapped on a scale of 4 miles to 1 inch.

**QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the province north of the St. Lawrence are also available.

**ONTARIO**

A large part of the province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

**THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the provinces of Manitoba, Saskatchewan and Alberta.

**BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the province, have been reported upon and mapped.

**YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

**THE NORTH-WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to *THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

**THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:****NOVA SCOTIA**

- 1019 City of Halifax Sheet.  
1025. Waverley Sheet.

The above two sheets belong to the regular series of Nova Scotia map sheets on a scale of one mile to one inch. The first includes Halifax City and Harbour, the second the Waverley Gold District.

**ONTARIO**

1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

**BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shews the geology and location of veins.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch, by W. H. Boyd.

NOTE.—Maps recently published may be had on linen cloth for use in the field at the price of 10c. per copy.

**REPORTS**

1072. Summary Report of the Operations of the Geological Survey for year 1908.

The Geological Survey, under certain limitations, will give information and advice upon subjects relating to general and economic geology. Mineral specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to *THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

*When answering Advertisements please mention THE CANADIAN MINING JOURNAL.*

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries**  
Quebec.

## Province of Nova Scotia

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,03 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

## Synopsis of Canadian North-West Mining Regulations

**COAL**—Coal mining rights may be leased for a period of 21 years at an annual rental of \$1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

**QUARTZ**—A person 18 years of age, or over, having discovered mineral in place may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is \$5.

At least \$100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When \$500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at \$1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee \$5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental \$10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds \$10,000.

W. W. CORY, Deputy of the Minister of the Interior

Catalogues sent on application.

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

**General Passenger Department, Intercolonial Railway**  
**MONCTON, N.B.**

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

## Canadian Westinghouse Co., Limited

General Office and Works, HAMILTON, ONTARIO.

# HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and  
Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other  
Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT TORONTO KENORA WINNIPEG, MAN.  
VICTORIA, B.C. VANCOUVER, B.C. CALGARY. ALTA. NELSON, B.C.

### **A 5 Electric Rotary Drill**

for

Coal, Slate, Shale, Clay, Gypsum, Rock Salt, etc.

This machine can be absolutely depended upon to drill any material which can be penetrated by an auger bit.

Bulletin X 16

Contains illustrations and complete data. Mailed on request.

## **JEFFREY ELECTRIC LOCOMOTIVES**

### **THE COST OF MAINTENANCE**

of Jeffrey Locomotives has been shown by actual records to be less per ton mile than any other make of Electric Locomotive.

**We build Complete Coal Mine Equipments**

**THE JEFFREY MFG. CO., Columbus, O, U.S.A.**

**Canadian Office and Works: - MONTREAL.**

# **SULLIVAN AIR COMPRESSORS**

This picture shows an 1850-foot Sullivan Class "WC" air compressor in the engine room of the Temiskaming Mining Co., Ltd., at Cobalt, Ont. This compressor has tandem corliss compound steam cylinders and tandem two-stage air cylinders.

It unites low steam economy with high air and efficiency, thorough workmanship, and low cost for freight and foundations.

These features have led to the purchase of similar machines by the Crown Reserve Mining Co., Ltd., the Kerr Lake Majestic Mining Co., Ltd., and the City of Cobalt Mining Co., Ltd.

**Send for Bulletin 658-D.**

### What a User says of the Deister:

I have yours of the 7th inst. and am pleased to advise you that the results obtained at our Calvario mill with the Deister No. 3 Concentrating tables under my personal observation in treating the ores from the Carboncillo mine were not only satisfactory but have made it possible for us to treat one of our low grade ores at a good profit which heretofore could not be treated except at a loss. Ours is a gold-silver ore which was given to your table through an 80-mesh screen at the rate of about 12 tons per 24 hours. The table requires but very little attention and from our experience I am convinced that there is no machine now in use which could give us the results obtained.

Neg. Minera "El Carboncillo y Anexas, S. A.," Zacualpam, Mexico. Yours truly, (Signed) A. C. Chabaud, Mgr.

# Behrend Concentration System

## Combination WET and DRY

A complete recovery from all slimes and minerals such as Graphite, Galena, Stibnite, Chalcopyrite, Tetrahedrite, Sylvanite, Molybdenite, Stephanite, Argentite, Ruby Silver and Native Silver.

This system will make low grade deposits pay. Every mine having an eye to business should investigate this system which has the approval of leading mining authorities.

A completely equipped plant, including concentrators, crushers, rolls, etc., for testing purposes is located at address below. Forward a sample of your ore for preliminary test.

## Behrend Concentrators, Limited

48 Inspector Street, Montreal

## Underwood

The man who buys an Underwood typewriter does not bring the price into discussion.

He does not buy the Underwood on a price basis. He knows that to pay less is to get less—a great deal less.

He knows that in buying an Underwood he will get full value for every cent of the cost. And for this reason, Underwoods in Canada outnumber all other makes of typewriters combined.

Most roofings are made of only *one layer*, but Amatite is made in *five layers*. The bottom layer is wool felt, the next is real Coal Tar Pitch, the third is wool felt, the fourth is pitch again, into which is embedded the fifth layer, namely the *mineral surface*.

If the weather should, in the course of years, wear away the mineral surface and dispose of the layer of Pitch which is the most

waterproof substance on earth), it would still have to penetrate a layer of felt and another layer of composition and another layer of felt before the roof would leak.

It is easy to see why Amatite lasts so long when you realize how it is made.

That mineral surface requires no painting or coating whatever, and will take the brunt of the weather without renewal or attention or care.

Send for a sample of Amatite. It's free.

# ELECTRIC HOISTS

## On Hand

Owing to the failure of one of our customers due to the financial depression, we have on hand two Electric Hoists as follows:

1 double drum electric slope hoist having drums 60 inches diameter by 38 inches face arranged tandem. Capacity 8000 lbs. at speed of 350 feet per minute on a 35° slope, equipped with 75 H.P. type F. alternating current motor, 440 volts, mounted on same frame and having the necessary controller and resistances, dial Level indicator for each drum.

1 double drum electric hoist for vertical shaft, drums 60 inches diameter by 38 inches face arranged parallel. Capacity 4000 lbs. at speed of 450 feet per minute, skips being operated in balance equipped with 60 H.P. type F. alternating current motor 440 volts, mounted on same frame and having the necessary controller and resistances, dial Level indicator geared for 500 feet.

They are high class machines in every respect and will be sold at a low figure.

### RECIPROCITY IN COAL.

The article on reciprocity in coal, that appears in this issue, should arouse comment.

In the Maritime Provinces the question has long been discussed. With a few exceptions, the coal operators of the East appear to be vigorously opposed to the removal of tariff restrictions. On the other hand, there is decided, though not extensive, public sentiment in favour of reciprocity.

Throughout Quebec and Ontario reciprocity would be welcomed, merely because it is believed that the price of fuel would thereby be lowered. In the middle and far West there is a general sentiment in favour of reciprocity. It is urged that the adequate development of Alberta's and British Columbia's coal fields cannot take place until reciprocity is an accomplished fact. Roughly, this sketches the condition of Canadian opinion at present.

It is contended by western coal operators that reciprocity will benefit Canada generally, and that their eastern brethren will lose nothing if the tariff wall is razed. To this the easterners reply that free United States coal would swamp our markets completely.

We shall not reiterate here any of the arguments, facts, and figures adduced by Mr. Jacobs. Our intention is solely to arouse interest in a question that affects vitally the future of the Dominion.

Mr. Jacobs alludes to the surprising apathy on the part of the Canadian public in regard to reciprocity in coal. So marked is this apathy that the activity of Nova Scotian operators is thrown into undue relief. When Parliament was discussing the subject last winter, the views of the larger coal mining interests of the East were forcefully presented. Western interests claimed and received scant consideration. Hence there was little debate, and no constructive measures were suggested.

Apart from sporadic paragraphs in the public press, hardly one attempt has been made to ventilate the situation fairly. The pronouncements that have appeared in Montreal papers, presenting the case for the East, must be regarded as, in some degree, special pleading. Similarly, western views have been set forth in local publications.

The only presentation of the question from a national point of view came from the pen of Mr. D. D. Mann, in a recent number of *The Saturday Evening Post*. Mr. Mann, having spun webs of steel over half the continent, has become something of a publicist. And there are few men of affairs to whom we can listen with more profit. His attitude towards reciprocity may be summed up in two sentences from his own article: "I cannot, at the moment, think of any considerable

manufacturing advantage that would be sacrificed by a readjustment of the coal tariff." And, "The tariff is, at best, an expedient. As its crude necessities are outgrown and the distribution of Nature's favours is better understood, the courses of trade will find their natural channels, and Canada, handicapped at the beginning by the wider range of business possible to her southern neighbour, will come into her own."

Mr. Mann, however, is too wise to give any degree of finality to his utterance. He recognizes tacitly that the last word cannot yet be said. The whole situation requires thorough, deliberate, and wide consideration.

It is evident that what will suit the West will not meet the approval of the East, and vice versa. Each party is confident that its point of view best conserves the interests of Canada as a whole. Both cannot be right. Somewhere in between lies the most profitable course.

Will it not be possible for the conflicting interests to meet and attempt to evolve a *modus vivendi*? It is not unreasonable to suppose that eastern operators know their own business best. Similarly, western mine owners should be the most competent judges of their own requirements. Instead of clashing at Ottawa, would it not be well to meet peaceably at Winnipeg!

Meanwhile the day is fast approaching when Canada will determine for herself whether she desires or does not desire reciprocity. Every year strengthens her position and places her less and less in the posture of a suppliant.

### GOWGANDA—ITS PROSPECTS AND ITS PERILS.

Anonymous destructive criticism and extravagant praise are two evils that threaten the silver mining regions of Northern Ontario. Of the two, the latter is immeasurably the more dangerous.

In its issue of July 17, *The Financial Post* of Canada, an enterprising weekly of somewhat nebulous convictions, devotes an editorial column to Gowganda. Quoting an anonymous "able mining engineer of undoubted authority," the *Post* accepts his statements and moralizes thereupon.

Before alluding to any of these statements, we wish to point out that our contemporary transgresses the rules of fair play and of editorial decorum in publishing such matter. The *Post's* strictures are based upon specific statements. They are directed against specific mining companies, the Mann, Bonsall, Bartlett, and Boyd-Gordon.

Disregarding the question as to whether these strictures are just or unjust, it is evident that the companies that are attacked are given no chance to defend themselves. The *Post* does not accept responsibility for its editorial, and the identity of the person whom they quote is carefully suppressed. As to his ability and standing, we must accept (or reject) the *Post's* warm asseverations. Hence our contemporary is in the posi-

tion of the small boy who puts pepper on the stove when no one is looking—and is prepared to sneeze with the rest.

If the *Post* feels called upon to attack mining companies and to dabble in mining generally, it must assuredly prepare also to speak and act for itself. Hiding behind the skirts of an unknown is neither sportsman-like nor edifying.

If the *Post's* informant is what the *Post* believes him to be, he was at least ill-advised to vent his opinions anonymously. But we believe that there is internal evidence to show that either the *Post* is misquoting its "expert," or, on the other hand, its "expert" is a broken reed.

One sentence from the editorial in question calls for comment: "That he [the expert] is conservative is," says the *Post*, "evidenced in his statement that the Cobalt mines have probably reached the climax of their high-grade production." Now, this is not conservatism; it is exactly the antithesis of conservatism. The conservative mining man does not draw a bow at a venture. He gathers his evidence systematically and carefully, and formulates his conclusions sanely from observed facts.

A conservative mining engineer might easily come to the conclusion that Cobalt had passed its zenith. An utterly incompetent person might also come to the same conclusion. Hence the conclusion has nothing to do with the case. Obviously the thing that counts is the method employed in reaching the conclusion. Our contemporary has fallen into the common error of confounding conservatism with pessimism. The most conservative mining engineer in the world would neither lose nor gain in conservatism by speaking highly or disparagingly of Cobalt or Gowganda.

The point made by the *Post* regarding the fact that practically no ore has yet been shipped from Gowganda is not well taken. There is ample time yet for this. Its reference to overequipment is fair. But the whole editorial loses meaning because of its dubious birth.

When next the *Post* wishes to instruct its readers in this direction, we suggest that it take time for meditation. The only straight course is to get your facts first-hand and tell the truth boldly off your own bat.

It is yet too early to jump to conclusions concerning Gowganda. Development has been slow. The silver-bearing veins have proved irregular. Transportation facilities are lacking. The camp has not settled down to efficient production. The effects of extravagant advertising and injudicious expenditure are apparent. These will handicap the camp for a long time. But sooner or later, legitimate mining, conducted by efficient engineers, will determine the destiny of Gowganda. When that time arrives we shall know whether Gowganda is to be a second Cobalt or a flat disappointment. Neither subsidized eulogies nor the opinions of a thousand "experts" can alter by one milligram the silver contents of the new North.

**PUFFING.**

It is bad enough to read ordinary newspaper puffs of mining districts. Usually these purport to be interviews with "eminent" engineers. Always they are overdone.

But it is worse to see responsible officials misquoted. One of the most offensive specimens of misquotation has been brought to our attention. The Mining Age, of New York, in its issue of August 10, published an absolutely spurious quotation supposed to have been extracted from a public address delivered by Dr. W. G. Miller.

Here is the quotation:—

"In a recent address at Cobalt, Prof. Miller said:

'Values at Cobalt will reach at least to a depth of 400 feet. On the Lawson property the geology is such that it is only reasonable to expect the values to go deeper there than anywhere else in the camp. The Kerr Lake, which adjoins, is mining high-grade ore at 400 feet. The history of the Crown Reserve is well known. The ore is so full of metal that it takes only six cubic feet to make a ton. Assuming a length of 600 feet on the Lawson and an average width of high-grade ore of one foot, there is already in sight 100 tons for every foot in depth. The ore runs 7,000 ounces to the ton, but assuming only a net value of \$1,000 a ton, the first foot from the surface should yield \$100,000. One hundred feet of that vein will make 10,000,000, or practically the selling price of the entire La Rose mine. Such an estimate would be extremely conservative.

'These figures stagger the imagination, but it is easy to calculate. I do not believe that the mining engineers realize the value of the Cobalt camp, or, if they do, they are afraid to make their impressions public lest they be accused of exaggeration.' "

Not to mince matters, the writer who gave this to the Mining Age was guilty of deliberate fraud. The excerpt is given in quotation marks to make the statements appear as if they had been taken from a verbatim report. Dr. Miller did not make the statements attributed to him. The language in which the extract is couched is entirely misleading, and the whole article is designedly false. No decent paper should lend itself to such cheap touting.

**NEWFOUNDLAND.**

Ten years ago Canada was popularly supposed to be a fringe of snow-clad territory decorating the northern boundary of the United States. To-day Canada is the centre of attraction for emigrants of all nationalities.

Newfoundland to-day is still terra incognita. All the erroneous ideas that were current concerning Canada a decade ago are now current concerning Newfoundland. The ancient colony has not been properly advertized. Its people are profoundly insular. Its changing governments are tied hand and foot by fac-

tion and prejudice. Hence Newfoundland has remained voiceless, save when some rash Canadian suggests confederation or a Washington politician monkeys with the Fisheries Treaty.

Yet Newfoundland is a country of specific promise. Her mineral wealth is hardly touched. Of copper she has known, large, workable deposits. Her iron ore supplies the Sydney furnaces. Gold has been found, and is being worked. Coal of good quality and in fair quantity has been discovered. Gypsum, feldspar, building stones occur in abundance. Of tin there is rich indication. And so through the gamut of commercially valuable minerals.

A month or so past our representative visited Newfoundland. The first of his articles appears in this number of the Canadian Mining Journal. Others will follow.

**THE GLACE BAY STRIKE.**

The letter from our Glace Bay correspondent, to be found under the heading "Special Correspondence," is a clear resume of the present condition of the strike and of the causes that have led up to it.

Particularly interesting is our correspondent's delineation of the objects and methods of the United Mine Workers. With some surprise we learn that "the U. M. W. A. have five of their officers from the United States, assisted by a clerical force of two female clerks and a male clerk." This staff has been imported for the express purpose of destroying the Provincial Workmen's Association and holding up the Dominion Coal Company.

There appears to be no room left for moral suasion. We are strongly of opinion that the Federal authorities should promptly deport the leaders of this senseless agitation. This is about the only complete safeguard that remains.

**EDITORIAL NOTES.**

Our London contemporary, The Mining Journal, is to be congratulated heartily upon its improved dress. Beginning with its issue of July 3rd, The Mining Journal assumes a much more convenient size, and more orderly paging. This changes will be welcomed by its readers everywhere. Changes of this kind are, from many causes, exceedingly difficult to make. Sentimental considerations are not the least important deterrents.

The benefits of constantly improving methods of coal mine inspection are strikingly illustrated by comparing statistics of 50 years ago with those of to-day. The average output per person killed for five years up to 1860 was 74,674 tons. The output for 1008 per person killed was 210,815 tons, or almost three times the amount of coal raised per person killed.

The director of the Geological Survey, Mr. R. W. Brock, who was in hospital in Ottawa during the former half of July, continued to transact much routine business by telephone from his sick-room. Immediately on leaving the hospital Mr. Brock, although hardly able to walk, took train for British Columbia, there to join the

Hon. Mr. Templeman in an official tour of inspection. This is an almost dangerous instance of enthusiasm.

Mr. Alex. Gray's eminently useful summary of the progress and financial status of Cobalt mines is noticed in another column.

## MINERAL RESOURCES OF NEWFOUNDLAND.

(Written specially for The Canadian Mining Journal.)

"Newfoundland is a country that has undergone many vicissitudes during the earlier geological epochs," said J. P. Howley, F.G.S., Government geologist of the colony, in a paper recently read before the Canadian Mining Institute. "Its rock structure consists chiefly of the most ancient series comprised within Archaean, Eozoic and Palaeozoic times, such as the Laurentian, Huronian or Pre-Cambrian, Cambrian, Silurian, Devonian and Carboniferous. It is, consequently, one of the oldest countries in the world.

Large areas are found to be occupied by igneous, eruptive and igneo-aqueous materials, otherwise highly metamorphosed sediments, indicating prolonged volcanic action at different periods of its structural history.

"Still later, during the post-pliocene glacial epoch an immense ice-mantle seems to have enveloped the whole surface of the country. This ice-cap, descending from the higher elevations towards the sea, acted like a cyclopean ploughshare. It tore up and pushed or carried along with it everything that came in its way, scattering broadcast over the surface innumerable granitic and other boulders and planed down the entire face of the country. It was this same agency that moulded the country into its present contour of smooth, rounded, rolling ridges and low valleys. There are no sharp, serrated peaks, such as are visible in non-glaciated countries. Here and there throughout the interior a few isolated, truncated bosses of granite or trap rear their heads above the general level. These are known locally as "Tolts" and correspond closely with the American "Butte" or the South African "Kopje".

"In several respects the geological structure of Newfoundland bears a striking resemblance to that of parts of England. On its eastern seaboard we have the structure of Wales repeated in the Cambrian deposits. Sediments of an almost identical character, holding similar fossil organisms, are found on the shores of all the principal southern and eastern bays, even the celebrated Carnarvon slates being repeated here.

"Fossils of the Silurian and Carboniferous ages, while closely allied to those of both the Eastern and the Western Continents, nevertheless, possess some local peculiarities which seem to point to a transitional or intermediate stage between the two. This would go to bear out the expression that "Newfoundland is a stepping-stone between Europe and America."

"It would be but reasonable to expect that in a country so composed of the most ancient rock formations, one that has undergone so many changes, mineral wealth of no mean order should occur. Such has been abundantly proven to be the case; although mining may be looked upon as still in the infant stage."

### Copper Mining.

Mining on a large scale was initiated about forty-five years ago, when one of the Tilt Cove mines was

opened. Several other copper mines have been operated in Newfoundland within recent years:—Betts Cove, opened in 1875, and Little Bay in 1878. The scale on which the Betts Cove mine was worked may be judged from the fact that when work there was in full blast the yearly wage bill was upwards of \$125,000. Unfortunately, combination of low prices and financial difficulties drove the operating company out of business and this mine is now lying idle. Little Bay mines were also abandoned for practically the same reasons. It is believed that considerable quantities of ore are still waiting the miner at both these locations and local companies are now negotiating for the reopening of the old mines. Two most promising copper areas are now being vigorously prospected, one at York Harbor, Bay of Islands, in the west of the Island, and the other at Goose Cove, Hare Bay, in the north. Plants are being installed at both locations and it is anticipated that in the near future these new workings will become large copper pro-

Reid's Granite Quarry, near Gander Lake.

ducers. At Goose Cove it is expected to have 3,000 tons ready for shipping at the end of the present season.

Practically all the prospecting has been done on the coast of the island. This has been rewarded with numerous indications of copper ore. In the southern part of the island it has been found that the Huronian series contains very rich ores of copper glance, tetrahedrite and bornite. The Government geologist reports that native copper occurs in large quantities in Placentia Bay, on Oderin Island. Some portions of the rock in this location—greenstone and amygdaloidal trap—are quite rich in the metal, which is disseminated throughout in the form of fine scales or particles. At one place where the overhanging cliff had fallen down, large masses of copper were found amongst the debris. The Newfoundland Development Co., the big concern controlled by the Harmsworths, which is developing the pulpwood on so large a scale, has discovered copper near Red Indian Lake, in the very heart of the interior. Statistics from

the Newfoundland geological department show that up to date 1,319,594 tons of copper have been shipped from the various mines of the island. To this can be added 78,015 tons regulus and 5,418 tons copper ingots produced in the same period. The percentages of copper in these ores ranged from 4 to 30 per cent. Taking the average as 15 per cent the total yield of metallic copper would be over 210,000 tons.

#### Iron Mining.

Practically every variety of iron ore is found in Newfoundland, although only one location has been developed to any extent. The area in question is in Conception Bay, on Bell Island, and is one of the most profitable mines ever operated. Referring to this area in a recent report, Mr. J. P. Howley makes the following observations:—"Great Bell Island is one of a group of

three islands situated in Conception Bay, near its south side. It is the largest and lies furthest out from shore; is about six miles long by about two miles wide, having a surface area of twelve square miles. It forms, with the other two islands, the remnant of what was once a great trough of Cambrian rocks, which occupied the entire area of the bay. The former existence of this trough is plainly indicated by the presence of narrow fringes of its basic members, stretching along the shores of the bay on either side. On the south side, a fringe of about one mile wide extends along shore some ten miles, facing the bay and dipping towards the water, while on the north side, on the outer headlands, isolated patches of similar rocks are met with, dipping in the opposite direction, also towards the water. The islands above mentioned form the highest portion of this former trough now visible, but the centre of the trough must still lie out beneath the water, some three or four miles north from the great Bell Island. Numerous typical fossils of the upper Cambrian series are found on this island, the strata which lie pretty flat, have a general inclination towards the north at an angle of 8° or 9°.

Interstratified with the shales and sandstones, composing the structure of the island, there are altogether twelve bands of ore, ranging in thickness from one to ten feet. The two largest bands near the top of the section are situated on the northern slope of the island, and occupy the segment of an ellipse. So accessible are these beds, and so little capping of rock or debris covers their out crops, that almost every ton of ore they contain can be recovered. The Nova Scotia Steel and Coal Company were the first to operate a mine here. They commenced work in 1895, when they shipped their first cargo of ore. In 1899, they sold out the lower and larger bed to the Dominion Iron and Steel Company, since when the work of mining has been vigorously prosecuted by both companies. Up to the end of last year they had shipped between them 7,000,000 tons of ore, and have still in reserve, on the land area alone, about 25,000,000 tons. Most of the Dominion Company's ore goes to the smelting establishment of that company in Sydney, Cape Breton, while that of the Nova Scotia Company finds its way to various markets in both Europe and America.

Both these companies are the holders of large submarine areas, covering the ore deposit under the bay. That of the N. S. Company comprising 33 square miles. In view of the rapid diminution of the ore on the land area of the former company, they have, during the past two years, been driving out under the water, in order to reach their claim, which is situated three-quarters of a mile from the shore, the latter company holding a claim for the first mile contiguous to the shore of the island. Two main parallel drifts, commencing on the land, and following the slope of the ore bands seaward, have now reached well within the company's boundary. In driving this slope the ore has been found to maintain its general character throughout, but to increase both in thickness and quality as the centre of the trough is approached. By the aid of the dips and strikes of the strata it is possible to form a fair idea of the extent of the trough. Unless some unforeseen disturbances should occur cutting off the ore, or throwing it out altogether, and provided the ore bands maintain their thickness and regular stratified character throughout, a fairly reliable result can be arrived at. According to this mode of figuring then, I find the trough should contain the enormous amount of 3,635,543,360 tons. Of course this estimate takes into account all the ore bands now known to exist on the island."

**Iron Pyrites.**—This is an abundant mineral in Newfoundland, especially in that section known as Notre Dame Bay, where it occurs in connection with copper-bearing ores. Only at one place has mining for this material been carried on to any considerable extent. From this mine, at Pilley's Island, over half a million tons were shipped during the last twenty-five years. The product of this mine averaged about 50 per cent. sulphur. Deposits of this mineral are also being prospected at Bay of Islands and at the south-west arm of Green Bay.

**Lead.**—Numerous veins of galena have been discovered in various parts of the island, but more especially around Placentia Bay. At one place in this neighborhood, named LaManche, mining was at one time carried on on a large scale, about twenty thousand tons of the ore being taken out.

**Chromite.**—There are several known deposits of this valuable mineral on the island. Mining on a small scale was carried on for some time by the Humber Consolidated Mining Co. at a deposit near Bay of Islands, and during the three years that the somewhat spasmodic operations were carried on about ten thousand tons were taken out and shipped.

**Precious Metals.**—Practically all Newfoundland copper ores carry considerable proportions of gold and silver and the amount of the former extracted from the ore taken out of the Tilt Cove mines adds considerably to the income of the company. A plant for the mining of gold is established at Mings, in Notre Dame Bay, although, for lack of capital, it is not at present worked. Gold is also known to occur at a point in White Bay, a little farther north than the last-mentioned location. The galena ores of Newfoundland are highly argentiferous and an authority states that they have run as high as 400 ounces to the ton. The most promising deposits of silver at present known are situated at a place named Lawn, in Placentia Bay.

**Building Stone.**—The best testimonials to the value of the areas of available building stone on the island are the public buildings in which the native material has been used. A splendid example is the building in St. John's, containing the Law Courts and some of the Colonial Governmental offices, Newfoundland sandstone from Kelley's Island, near the famous Bell Island mines, Conception Bay being used in its construction. The facing is syenite from a quarry situated at a place called Petites, on the south coast of the Island. Water Street, St. John's, is paved with granite blocks taken from a quarry of the Reid-Nfld. Co., in the interior. Marble has also been discovered in abundance and an effort is being made to form a company to develop one field situated on the the west coast. The marbles discovered have been of almost every conceivable shade of color. Other varieties of building and ornamental stone known to exist in workable quantities are porphyries, freestones, limestones, serpentines, soapstone.

**Roofing Slate.**—A large portion of the Avalon Peninsula, including, Placentia, Conception and Trinity Bays in the south of the island, is of the Cambrian formation and contains some of the best roofing slates quarried. The principal quarry is situated at Wilton Grove, in Trinity Bay. The slate is of various shades of color, dark purple prevailing and there is also an extensive band of pale sea-green color. Experienced Welsh slaters are employed in working the quarry, which up to date has produced over 150,000 squares, having a total value of something like \$450,000. The slate has been pronounced to be the equal of the best product of Carnarvonshire, Wales. One

of the directors of the United States Geological Survey, who examined the quarry, reported that "this is one of the great roofing-slate deposits in the world, being comparable with that of North Wales and the American deposits of Washington County and Rutland County, Vermont."

**Coal Areas.**—These are treated in a separate article. It is interesting to note here that Professor Jukes visited them almost half a century ago, and estimated that one area alone was about twenty-five miles long by ten in breadth. Of recent years a number of seams have been discovered, all of which are being tested by the government geologist, Mr. Howley.

Of other minerals that have been discovered in workable quantities we have antimony, manganese, and tin. A most promising deposit of the first-men-

tioned occurs on the north-east coast of the island at a place called Moreton's Harbor. An attempt was at one time made to mine it, several thousand tons being taken out and shipped. Extensive deposits of manganese of a low grade are found in various parts of the island, more especially around Conception Bay, where it occurs in conjunction with limestone. An attempt is now being made to mine this mineral at Manuels, Conception Bay. Recently a body of tin-bearing ore has been discovered at How Harbor, Har-Bay, in the far north of the island, and assays of some of the specimens taken out showed the presence of over two per cent. of tin. A big body of talc on the south side of Conception Bay is being worked. An overhead tramway and a large pier have been built and already several thousand tons have been shipped to the American market.

## COAL AREAS OF NEWFOUNDLAND.

By James P. Howley, F. G. S., Director Nfld. Geological Survey.

There are in Newfoundland three distinct carboniferous areas, one in the Codroy Valley, west coast, another in the country lying to the south of Bay St. George and the third on the upper reaches of the Humber River, Bay of Islands, in the region between Grand and Sandy Lakes. The first named is of very limited extent, being a mere segment of a trough, cut off by a great fault. There are two little patches of about a mile each in longitudinal extent, but the greatest thickness of the true coal measures does not exceed 250 to 300 feet in all. Nevertheless, within these narrow

its strike, gave an average thickness of 7 1-2 feet. The nine-foot seam was drifted upon for ninety feet, and about 100 tons taken out. Some of this coal was used by the Reid Railway Co. on their locomotives, with excellent results as a steam producer.

The Bay St. George coal area is in the form of a narrow trough situated some eight miles inland from the south shore of the bay. The full extent of this trough is not yet known, but it has been traced longitudinally for about five miles. Three brooks which have cut channels across it afford the only sections of

Diamond Drill at Work—Bore F, Kelvin Brook, Grand Lake.

mits there are six seams of coal, all standing in a vertical position. Four of the six are of small dimensions, but the remaining two are of some considerable extent. One at its outcrop showed 9½ feet of good, clean coal, while the other at one point was 23 feet wide, consisting of layers of coal, shale and clay, and containing 5 feet of fairly good coal. They did not, however, maintain this thickness throughout, but were found to vary considerably; the first had dwindled down to five feet, with only three feet of coal, while the larger seam, which was uncovered at five different places along

the measures. On the most westerly of these, called the Middle Barachois, a good section of about two miles in extent is exposed. When this was stripped with pick and shovel twelve separate seams of coal were revealed, on the north side of the trough toward which they dipped, most of them being also uncovered on the opposite side.

The seams ranged in thickness from a few inches up to over five feet, and the coal in several was of first-class quality. On Robinson's River, two miles east, and on one of its tributaries, small exposures of the

No. 6 Coal Seam—West Side Aldery Brook.

coal measures were again met with. The Robinson's River section contained three seams, one of which gave a thickness of 4 feet 2 inches of good solid coal, and on a northern feeder of the River four seams were uncovered. Only one of the latter was of any importance measuring in width 1 foot 6 inches, the coal of an exceptionally superior quality, being clean, bright and semi-anthracitic in character. It was low in sulphur, burnt with a bright, clear flame in an open grate, and left but a small percentage of ash.

The coal seams of one foot and over in thickness so far discovered in this trough are as follows:

Coal Seam, Codroy.

|                    | Ft. | Ins. |
|--------------------|-----|------|
| Murray Seam .....  | 5   | 4    |
| Rocky Seam .....   | 1   | 5    |
| Clay Seam .....    | 1   | 8    |
| Slaty Seam .....   | 1   | 4    |
| 18-inch Seam ..... | 1   | 6    |
| Jukes .....        | 4   | 6    |
| Cleary Seam .....  | 2   | 2    |
| Howley Seam .....  | 4   | 2    |
| Shears Seam .....  | 1   | 2    |

The aggregate thickness of all the seams in this trough is 27 feet, which, should they maintain this average throughout, would give 25,920,000 tons of coal for every mile of superficial area they underlay.

In the Humber Valley, the Carboniferous series spreads over fully five hundred square miles of coun-

Coal Seam on Coal Brook, Grand Lake.

try, but by far the greater portion of this is occupied by the lower and unproductive members of the series. Here again the true coal measures are confined to a long, narrow trough, which extends along the south side of Grand Lake some four or five miles, and thence strikes north-easterly into the flat country lying between Grand and Sandy Lakes. This trough has now been traced over eleven miles on its strike and in all probability it terminates in Sandy Lake, some six or seven miles further on!

The country hereabout is very difficult to explore owing to the immense accumulation of superficial debris, in the shape of sand, gravel and boulders, spread out over the surface in all directions and effectually concealing the structure beneath. Of late years the

Calyx boring drill has been brought into requisition to test this coal field and we are gradually acquiring a fuller knowledge of its extent and possibilities.

One small section has been uncovered at Aldery Brook on the south side of Grand Lake, two miles from its head. Here the trough is very narrow and lies close up against the Laurentian Hill range. It does not exceed altogether a quarter of a mile in width, yet it contains thirty outcrops of coal, all crowded together, in a nearly vertical position. Owing to the doubling

Camp MacGregor, Coal Boring.

up of the strata these outcrops, in reality, only represent fifteen distinct seams. They vary from a few inches up to six-and-a-half feet in thickness. The largest seam was drifted upon for 150 feet, and a great deal of coal of excellent quality was taken out. Several of the other seams were also partly opened up and some good coal extracted from them.

Six seams in this section exhibited the following dimensions at their outcrop: 2ft. 0in.; 1ft. 6in.; 1ft. 8in.; 6ft. 6in.; 3ft. 0in.; 2ft. 6in.

One-and-a-half miles further east, on Coal Brook, eighteen outcrops were observed, representing nine different seams. Here the trough begins to widen out somewhat and the angle of inclination of the bedding assumes a dip of 50 deg. or less. Six of the seams had the following dimensions: 1ft. 4in.; 3ft. 5in.; 1ft. 0in.; 1ft. 6in.; 2ft. 4in.; 1ft. 0in.;

On Kelvin Brook, two-and-a-half miles still further south along the strike, a small section on the south side of the trough exhibited six seams, three of which showed: 3ft. 8in.; 2ft. 6in.; 6ft. 2in.; The Reid Nfld. Railroad Co. mined one of these seams for a while taking out about 7,000 tons of coal, all of which was used on their locomotives, with quite satisfactory results.

Three-and-three-quarter miles eastward, where the railway crosses the trough, three seams were discovered by sinking pits through the gravel and sand. They were all on the south side of the trough, dipping nearly north, at a much lower angle, indicating a considerable widening-out of the measures. Owing to the utter impossibility of accomplishing any further effective work here with pick and shovel, recourse was next had to the boring rod. Ten holes have been put down at short intervals apart and several new seams thus discovered. Seventeen seams were bored through during the past two years, which, with the three previously mentioned, making twenty altogether, so far discovered in the Grand Lake section. As in the other cases, they vary from a few inches up to something over three feet. Nine of them ranged from one foot upwards, as follows: 2ft. 6in.; 3ft. 4in.; 1ft. 6in.; 3ft. 0in.; 2ft. 6in.; 1ft. 0in.; 2ft. 4in.; 1ft. 0in.; 1ft. 6in. Several thousand tons of coal were also taken from this section by the Reid Nfld. Co. and burned on their locomotives. It is at present impossible to estimate the amount of available coal in this area, but it must unquestionably mount into many millions of tons.

The following analysis will give some idea of the composition of these coals:

#### From Bay St. George.

## BETTS COVE MINE.

Betts Cove is situated in Notre Dame Bay on the north east coast of Newfoundland. It is reached from St. John's, the capital, first by railway to Erploys, a distance of 260 miles, and then by steamer, run in connection with the railway system, a further distance of 125 miles. The Cove itself is about 2,000 feet wide at its entrance, narrowing to about 200 feet at the head, and is about three-quarters of a mile in length, with a slight curve westwards. It is surrounded by perpendicular, sometimes overhanging, cliffs. A short distance back from the head of the Cove a high mass of rock stretches obliquely across and, trending westward, leaves a narrow ravine, the situation of the famous little mining town.

All along the shore of Notre Dame Bay and in the islands that dot its waters, numerous copper deposits of ranging extent have been found. Betts Cove is apparently the centre of this belt or zone of mineral.

posit was worked uninterruptedly, 117,000 tons of ore were shipped. The suspension of operations was then caused by a cave-in of the mine due to the robbing of the pillars of their ore. This tribute system was inaugurated to offset the damage done by the fall of a huge bluff which destroyed much of the plant. Financial difficulties, coupled with the low price of copper—£44 10s.—prevented the company from reopening this promising mine. The magnitude of the operations carried on while the deposit was being worked may be judged from the fact that in one year about £95,000 were paid out in wages.

When the mine was closed down a most complete plant was left standing there. Two substantial wharves were ranged along either side of the Cove and provided mooring space for several large vessels at a time. The principal buildings of the town included large warehouses and shops, the manager's residence,

BETTS COVE.

The enclosing rocks are chiefly diorites and serpentines, with some metamorphic formations, and belong to the lower Silurian system. The cuperiferous and pyritic ores are found in veins more or less continuous, and in pockets of varying sizes. In places the ore is free from any admixture of gangue filling, but where the latter is present it invariably consists of, chloritic slate, often heavily charged with iron and sometimes copper. The surface indications of the ore deposits generally consist of "gossan" and ironstone, usually much weathered and decomposed. The ore is a sulphide containing copper varying from one-half per cent. to twenty per cent. A promising body of pyrites has also been uncovered and samples of it have assayed from 43.75 to 46.74 per cent. of sulphur.

Operations were commenced at the Betts Cove mine during 1874 and the first shipment of ore was made in 1875. For the next ten years, during which the de-

and a number of other houses, occupying the foreground of the Cove. Behind these buildings was the barracks, a long, low building, occupied by the unmarried officials and containing also the surgery and dispensary. In the background were a number of other buildings, miners' houses and boarding-houses.

On the western side of the Cove, high up the hill, were the reverberatory smelting furnaces, enclosed in a large wooden building. Attached to this was a laboratory. At the head of the western wharf was situated smelting works, of more recent construction and containing six cupel furnaces.

The mine is situated about three-quarters of a mile west of the Cove, although to reach it via the road would entail travelling a much greater distance. The mouth of the shaft with its engine-house and hoisting machinery is at an elevation of about 500 feet above high-water mark. Near the mouth of the shaft is a

large copper floor, roofed over, on which the ore received from the mine was spread out and sorted, the larger masses being broken up to a size convenient for handling and being also freed from rock and iron pyrite. The culled material was afterward taken to a small lake, where it was washed with a hose and again carefully picked over. The better quality of this ore was afterwards shipped with the ordinary ore from the mine, while the poorer quality was sent to the smelting works to be converted into regulus. A tramway of ore 1500 yards in length conveyed the entire product of the mine to the waterside. For the first six or seven hundred yards there was a slight up-grade and the cars, each containing two tons of ore, were pulled over this by horses. Then succeeded an incline of 150 yards and a level section of about a quarter of a mile. The last section of the track, inclined at an angle of about 20° led directly down to the wharf.

This extended notice has been given the old Betts Cove workings and plant for several reasons. They show from the big plant installed, that the company carrying on operations had pinned its faith to the locality and was only forced out of business by poor management and financial troubles. Recent investigations have also convinced the Pillies Island Pyrites Co. that the deposits of pyrites referred to above will well repay working, and they have now upwards of 1000 tons piled on the surface, with as much more in sight, the result of a drift 36 feet long, so that in the very near future Betts Cove will again probably become a producer. Also, the old mining headquarters here was a centre from which radiated prospecting efforts all over the surrounding district. These prospecting tours resulted in the discovery of mining locations whose development promised much profits. Two of these deserve special mention, both being copper deposits. One

at Burton's Pond, is situated about two miles west of Betts Cove and here, when operations were stopped at the latter place, about 100 tons of copper ore had been deposited on the surface. Serpentine rocks have been found to run along the south-eastern side of the pond, being interstratified with quartzite, diorite and slate with steatitic bands. At the entrance of the pond there

Loading Pier, Betts Cove Copper Mine.

is a considerable display of copper pyrites and sulphide of iron, and it was here that mining operations were begun.

The second location to which reference has been made was at South West Arm, a few miles up the Bay from Betts Cove. The ore mined here was of a superior quality, yielding 26 per cent. of pure copper.

### PILLEY'S ISLAND MINE.

Pilley's Island is situated in Notre Dame Bay, on the north east coast of Newfoundland, and at a distance of about 250 miles from St. John's, the capital city of the colony. The geology of the island is similar to that of the other copper bearing areas of Newfoundland. The ore is found associated with serpentine, the strata consisting largely of chlorite slate, diorites, and

Pier at Pilley's Island.

olomites. The ore mined here is of excellent quality and is almost chemically pure, assaying 45 per cent. sulphur, 52 per cent. iron, 2 per cent. copper and about 1 per cent. alum. It is contained in a lenticular vein which dips 25° from the horizontal, the ore on this incline being traceable for over 700 feet.

Mining operations on Pilley's Island commenced in 1886 and were carried on uninterruptedly until 1899. Then for two years operations were suspended, but the mine re-opened and worked again until 1907 when it was again closed owing to the financial embarrassment of the Pilley's Island Pyrites Co., the owners, mainly New York capitalists. Arrangements have, however, been made by which it is likely that this mine will be once again opened up this season.

When operations were suspended in 1907 the prospects of the area were unusually promising. A 300 foot shaft had been sunk through the main one vein and various drifts made through it. A body of ore, 150ft.x140ft.x20ft. had then been blocked out from the fifth to the seventh level. The specific gravity of the ore is about 5, which gives an equivalent of about 7 cubic feet to the ton. A simple calculation from the figures given above will show that about 60,000 tons of ore are at present available. The continuity of the ore band has been proven by diamond drilling and sufficient data have been gathered to indicate the presence of a further quantity of 100,000 tons of ore.

The mine plant is an up-to-date one. It includes a 150 h.p., high-pressure, friction engine, with double drawn for hoisting purposes; an air-compressor of sufficient capacity to run fourteen rock drills; four return tubular boilers developing 700 horse-power, a 7 k.w. electric dynamo used exclusively for lighting the mine. There is also a thoroughly equipped machine shop and a smithy, in which mechanical apparatus is installed.

SHAFT HOUSES AND POWER PLANT OF PILLEY'S ISLAND MINES.

Ore pockets with aggregate capacity of 4,000 tons have been provided and are used during winter months when shipping is suspended. The mine equipment also includes a crusher fitted with inclined screens and conveyors.

Shipping facilities are such that ships of 5,000 tons

displacement can lie at the pier head within half a dozen yards of the shore and receive cargo. The harbor is commodious and is almost landlocked. There is plenty of timber in the neighborhood and conditions are such as to render mining operations possible at low expense.

### HARE BAY MINES.

North of a line drawn across the Island of Newfoundland from the bottom of White Bay on the east coast to Bonne Bay on the west coast, the great northern Peninsula stretches for upwards of one hundred and twenty-five miles towards the coast of Labrador being separated from the latter at its northern extremity by the narrow Straits of Belle Isle. Its shores both east and west are bold and precipitous and are indented with many fine bays and harbors. Towards the northern extremity of the east coast is an unusually large inlet known as Hare Bay, and several of the harbors and coves around this have recently become the scene of much mining activity. Attention has been given specially to Goose Cove, How Harbor and St. Julien's, in each case with encouraging success.

The Goose Cove property is situated adjacent to Goose Cape, which forms the extreme north-east corner of Hare Bay, where it opens on to the Atlantic. The rocks in which the copper lodes are enclosed are metamorphic and, like all the well-known deposits of Newfoundland, they occur in the supracrustal strata of the Quebec, or middle Silurian formation. The strata associated with the copper beds are slates, thin beds of fine conglomerates and quartzites. At the surface, owing to weathering, the beds are not conspicuous, but beneath they are more distinct and exhibit a dip toward the north east, though this, as well as their strike, is subject to variations. The slates between which the lodes occur are softer than the surrounding rocks, this facilitating sinking and drawing. The copper veins are interbedded with the strata and, necessarily, follow their flexures. In the concession which is now being prospected two copper veins have been traced. The main, or west, vein is a rather slaty bed of copper pyrites, containing no quartz or other gangue, and bearing a little east of north with a dip slightly inclined

eastwards. It has a width of two or three feet of compact copper pyrites which, when picked, yielded 8.85 per cent. copper according to an English assayer. The east vein is similar to the main vein with a nearly north and south strike. It is also interstratified with the slate, and has a surface width of from one to two feet. The deposits at Goose Cove occur in the same rock formation as, and under similar conditions to, the rich copper mines that have been worked in Notre Dame Bay, on the east coast of northern Newfoundland. Tilt Cove, for instance, has returned large dividends for many years and last year is stated to have made a profit of about £100,000.

A 74 foot shaft has been sunk through the main vein at Goose Cove and 12 men worked on the location all the winter, getting out 2,000 tons of ore. Analysis of this ore showed 10 per cent. copper; 24.6 per cent. sulphur and 19 per cent. iron, with traces of gold and silver. Mr. M. L. Parnell, one of the local owners of the location, has succeeded in forming a company in England, and an expert, representing the shareholders, is now on the ground directing operations.

The staff of miners is to be at once increased to 100 men and it is expected that by the end of July a first shipment of some 3000 tons of the ore will be made to Swansea. A recent report of the expert referred to, Mr. Brenton Symons, M.I.C.E., F.G.S., M.E., states the vein which, at the commencement of operations showed only two inches of ore, now shows 8 feet. The company will immediately erect the necessary machinery and expect to mine and ship at least 20,000 tons of ore before the close of the present season. The facilities for shipping are excellent. Goose Cove is a commodious harbor with a narrow entrance and perfectly sheltered from all storms. The depth of water is 20 to 40 feet and there are two or three spots where a 50

foot pier would be of sufficient length to load an ore boat of from 2,000 to 3,000 tons burthen. The mine is about three-quarters of a mile from the shore of the harbor.

St. Julien's is situated near the opposite, or south-east, Cape of Hare Bay. The copper lands are close to the shore. The country is very hilly, the prevailing rocks being limestone and granite, the quartz veins running straight, principally in a northwesterly and southwesterly direction, occasionally showing outcroppings of copper ore for hundreds of yards. A shaft sunk a short distance from the shore and about 35 feet above sea level showed a 13 inch vein of copper ore at a depth of five feet and when this had been extended to fourteen feet deep the vein had increased to 23 inches in width. Prospecting shafts were also sunk in several other places and in every instance the vein increased in width the deeper operations were carried, the quality of the ore also improving greatly. The widest vein of copper ore discovered in these prospects measured 2ft. 6ins., this at a depth of nine feet. An assay of the ore from this mine by a New York firm showed 14.65 per cent. copper and 26.19 per cent. sulphur; another by a German expert of three samples showed copper 26 per cent. 21 per cent. and 26 per cent in each instance,

will be brought into the camp at 44,000 volts, and the different mines will be fed at a voltage of 2,200.

Their plans call for the installation of one or two large electrically driven air compressors and they undertake to supply the mines with compressed air as well as electrical power. The cost per H.P. will be about \$50.00 per annum for a 24 hr. service.

It is expected that they will be serving their customers about Oct. 31, 1909.

#### Cobalt Hydraulic Power Co., Ltd.

CHAMBER—1,000 feet long, 20 feet wide and 26 feet high=100,000 feet (cu.).

INTAKE—347 feet, outlet 298 feet or a difference of 49 feet.

There will be two intake pipes 8 feet diameter and an outlet pipe of 22 feet. The two inlet pipes will be steel lined. The blow off pipe will be 12 inches in diameter.

This plant is situated six and three quarter miles south of the Kerr Lake siding of the T & N.O.R.R. at Ragged Chutes on the Montreal River. They will charge 25c per 1000 cu. ft. compressed air at 100 pds. pressure and at a.t. This is on their metered air power contracts.

PROSPECTING AT GOOSE COVE.

while an assay by Prof. R. E. Holloway, Government assayer, at St. John's, Nfld., showed copper 21.03 per cent with 3 dwt. gold per ton.

There are splendid shipping facilities here also. The harbor is commodious and well protected and the water very deep. Timber can be had in abundance and at small expense from a mill and lumber yard situated some little distance along the coast.

#### POWER DEVELOPMENT IN COBALT. MINES, POWER LTD. COBALT.

This plant is an electrical one situated on the Matibitchewan river some 25 miles from Cobalt. The company has the right to raise lakes feeding this power 40 feet. They will have a head of 312 which will be brought to the turbines through two steel tubes 5 feet in diameter. The electrical installation will consist of four generators 2500 H.P. each or 10,000 in all. It is proposed to keep one unite in reserve. There will be two transmission lines to Cobalt to prevent any break down, the right of way will be 135 feet. The current

The air will be piped to Cobalt at 110 pds. pressure through wrought iron pipes 20 inches in diameter and 40 feet long. These tubes are very heavy, the flanges being welded on. Each flange contains holes for 24 one-inch bolts, the holes being  $3\frac{1}{2}$  inches centre to centre.  $\frac{1}{16}$  inches cardboard is used as a gasket. Cement anchors are placed every half mile and between anchors expansion joints are placed. Loops supplying the mines will be 12 inch pipe. This company will also supply electric power.

Power from this plant is supposed to be supplied to the mines about the middle of October, but I think it impossible as the contractors that have the shaft sinking and tunneling for the chamber have had trouble with low water and in fact I heard that they had pulled out.

Cobalt should at last get cheap power as there will be two companies in opposition and looking for a market for their power. At present some of the mines are paying \$250 per drill per month on an 18 hour service. These two companies will do the same for less than \$4.00 per day, or say \$100 per month.

## RECIPROCITY IN COAL.—A WESTERN POINT OF VIEW.

Written for the Canadian Mining Journal by E. Jacobs.

Canada's total production of coal during all years to 1908, inclusive, has been about 131,000,000 tons; that of the United States about 7,284,000,000 tons. During five years, 1904-8, Canada produced 48,000,000 tons of coal; in the same period the United States produced 2,060,000,000 tons. Canada's production in 1908 was about 11,000,000 tons; that of the United States nearly 420,000,000 tons. With such extremely disproportionate production figures in view, the suggestion of reciprocity in coal between the two countries, if nothing else were taken into account, might well appear one that should be dismissed without further consideration. But there are other factors in the situation to be considered, and they are decidedly important in their relation to a question seriously affecting the industrial and domestic interests of extensive areas of the Dominion.

### The General Position.

Generally, the position seems to be this: There is an enormous quantity of coal of excellent quality in Canada—in the Maritime Provinces in the East and

in Alberta and British Columbia in the West, but practically none in about 2,000 miles of territory situated between Alberta and New Brunswick. On the other hand, there is no coal in the Northeastern United States; none thence immediately south of the International boundary line (excepting in Michigan) until North Dakota is reached, where lignite coal occurs; then there is coal in the Rocky Mountain region—Montana and Wyoming, and again there is coal (though not of nearly so good quality as that in British Columbia and Western Alberta) in the State of Washington. Thus nature, taking no account of future divisions such as have been brought about by the establishment of political boundaries, and ignoring artificial trade restrictions, placed much good coal in the far eastern and western parts of Canada respectively, but did not similarly favour the wide extent of intervening Canadian territory, thereby leaving this great expanse of country dependent in large measure for its fuel supply upon fields situated south of what afterwards became the boundary line between Canada and the States. So

• indicates working coal mines.

× indicates undeveloped coal mines.

The approximate market areas of the several mining districts are shown by the dotted lines. They are, reading from west to east, as follows: 1—Area supplied by Vancouver Island Coal Mines; 2—Small tributary to Nicola Coal Mines, recently opened; 3—Small tributary to Bankhead and Cannore, Alberta; 4—Small tributary to Edmonton, Alberta, Coal Mines; 5—Area, comparatively large, taking coal from Crow's Nest Pass Coal Mines in both British Columbia and Alberta, and others in latter province about Lethbridge, etc.; 6—Large area supplied by Pennsylvania, Ohio, etc.; 7—Large area supplied by Maritime Province Coal Mines.

it would appear, in these circumstances, that the natural position would be for the Maritime Provinces of Canada to be the chief source of fuel supply for the New England States, while Alberta and British Columbia would in large measure stand in a similar relation to the Pacific States. But the trade restrictions referred to, supplemented, or perhaps overshadowed so far as Canada is concerned, by vested interests and the stronger political influences of the Maritime Provinces, have combined, and appear determined, if possible, to strengthen their combination, to serve their own ends rather than assist in bringing about a change that fair play to coal consumers in Ontario and Manitoba and producers in Alberta and British Columbia demands.

#### Summary of Coal Mining in Canada.

Of the coal mining industry of Canada as a whole, the "Report on the Mining and Metallurgical Industries of Canada for 1907-8," issued early in the current year by the Mines Branch of the Canada Department of Mines, gives (p. 934) the following brief summary:—

"The annual output throughout Canada is now more than 10,000,000 short tons, of which about 60 per cent. is mined in the Maritime Provinces and 40 per cent. in the Western Provinces. The total output in Nova Scotia since 1785 has been about 83,000,000 gross tons, and in British Columbia since 1836 about 28,000,000 gross tons. In the Northwest Territories there has been mined since 1887 about 8,500,000 gross tons. There is, therefore, a total output on record to the end of 1907 of nearly 120,000,000 gross tons. At the present rate of production, as much more will be mined during the text ten years.

"The coal fields of Canada are not found in proximity to the centres of population. The Province of Ontario—the most populous province of Canada—has no coal deposits, hence the consumers of coal in this province find it more convenient and profitable to import their coal supplies from the nearer fields of Pennsylvania and Ohio, U.S.A.

"From 2,000,000 to 2,500,000 tons, or about 30 per cent. of our imported coal, is anthracite, which is not found in Eastern Canada. For similar geographical reasons it is probable that upwards of 20 per cent. of the total production of bituminous coal in Canada finds a market in certain northern parts of the United States.

"Our imports of coal aggregate about four times as much as we export, hence our consumption of coal is considerably greater than the amount mined in Canada. In 1906 our consumption of coal was estimated at 15,326,466 short tons, or nearly 60 per cent. greater than the production, which amounted that year to 9,782,601 short tons."

The foregoing review was written before the question of reciprocity in coal between the United States and Canada was once more brought into public notice. In connection with the last paragraph above quoted it may be mentioned that "The Coal Trade" for 1909 (published by the editor of "The Coal Trade Journal," New York), says concerning Canada's fuel imports:—

"During the fiscal year ending June 30, the imports of fuel into Canada were as follows:—

|                       | 1905.     | 1906.     | 1907.      | 1908.      |
|-----------------------|-----------|-----------|------------|------------|
| Receipts.             | Tons.     | Tons.     | Tons.      | Tons.      |
| Bituminous .          | 4,826,535 | 5,516,019 | 6,714,311  | 6,710,933  |
| Anthracite .          | 2,604,137 | 2,200,863 | 2,784,161  | 3,296,522  |
| Coke . . . .          | 371,593   | 480,222   | 557,842    | 565,273    |
| Bitum. dust . . . . . |           |           |            | 1,139,233  |
| Totals . . .          | 7,802,265 | 7,197,104 | 10,056,314 | 11,711,961 |

"Under the general tariff of Canada the duty on bituminous coal is 63 cents per net ton, and on bituminous dust, or slack, and upon charcoal, 14 cents per ton. There is no duty imposed upon anthracite or coke."

The opinion may here be offered that it is a matter for much surprise that when it came up lately there was so little public interest shown in this matter, though the explanation of the seeming indifference of the comparatively large coal-producing interests of the West and the larger body of consumers in Ontario and Manitoba may be attributed to doubt as to whether the United States would consent to the abolition of all duty on coal, provided that Canada would act similarly. But since the question is not one for the present only, but must increase in importance as the great coal resources of the Dominion become further developed, it is desirable that the views of men in positions to speak with more or less authority regarding it, be taken note of, and this notwithstanding that there appears no present prospect of reciprocity.

#### Some Production and Report Figures.

Before quoting recently given expressions of opinion of several well-known men, though, a few more production figures will be submitted, and, too, some notes concerning development in established western coal fields, and prospects in others known but not yet producing coal for market.

#### Coal Production in Alberta, British Columbia and Nova Scotia for Five Years, 1904-1908.

| Year.          | Alberta.<br>Short tons. | Brit. Columbia.<br>Short tons. | N. Scotia.<br>Short tons. |

\*Estimated.

No information is at hand relative to the quantity of coal shipped from Alberta to the United States, but the following figures give, in long tons, that from British Columbia for five years, 1904-1908: In 1904, 532,436 tons; 1905, 673,700 tons; 1906, 679,829 tons; 1907, 651,076 tons; 1908, 567,274 tons; total, 3,104,315 tons, or nearly one-third of the gross production. Adding that used in making the coke also shipped to that country, it is found that about 39 per cent. of British Columbia's gross output of coal for the last five years, notwithstanding the customs duty charged against it, was exported to the United States. The interest of

Western Canada in the question of reciprocity in coal is, therefore, very evident, especially since no very great increase in demand for coal may reasonably be expected from Canadian territory accessible at freight charges that are not prohibitory to a profitable coal trade.

It may here be mentioned that "The Coal Trade" gives the following as the tonnage of coal exported from British Columbia to San Francisco, California, during five years, 1904-1908: In 1904, 335,137 tons; 1905, 348,515 tons; 1906, 311,099 tons; 1907, 205,956 tons; 1908, 167,415 tons. It says further: "Of the three Pacific States, Washington is the only one producing a large amount of coal. Coal fields in this State are conveniently located with regard to the chief centres of population, and while the coal is of fair quality, there is nevertheless the opportunity for the importation of coal from the adjacent Canadian Province of British Columbia. This coal finds a market in Seattle and Tacoma and the vicinity thereof, despite importation duty, but naturally cannot stand rail freight to the interior, save in the case of that going all-rail to Spokane. The superiority of the British Columbia coal is also a factor tending to restrict the shipment of Washington coal to San Francisco, for, despite greater length of voyage, British Columbia coal is delivered in San Francisco in greater volume every year than is the coal from Washington."

#### Coal Mining in British Columbia.

The Provincial Mineralogist for British Columbia, in his review of coal mining in the Province in 1908 (vide "Report of Minister of Mines, 1908," pp. 194-195), says in part: "The coal mines of the Province have, for many years, been sufficiently developed to supply the domestic demand, and they, therefore, have had to look to the export market to increase their sales; unlike the metalliferous mines, whose product is taken to the market to be sold, the coal mines must wait until the market comes to them, or within their reach. The market for coal is, therefore, directly dependent upon, and in proportion to, the industrial activity of the district supplied. . . . This enlarging of the market must necessarily be gradual in a new country—and all the Pacific Coast is industrially new—but that an increase has taken and is taking place, a glance at the coal statistics will show. This increase has been fairly regular amounting to an average yearly increment of between 50,000 and 60,000 tons of coal, while at the same time, in ten years, the annual output of coke has increased from 35,000 to 247,000 tons, due to the growth of a special industry, viz., ore smelting."

Of new producers of coal in the Province, and of coal exports, the same official says: "The Hosmer colliery, in East Kootenay, began shipments in December of 1908, and while its actual production, having been but for one month of the year, was small, its development and equipment have placed it among the large mines, and it will have to be reckoned with next year."

"The colliery of the Corbin Coal & Coke Company, in the same district, also began shipping regularly during the year, making a small output, and, although not so extensively developed nor equipped as the Hosmer mines, may be counted upon for a very much larger production in the near future."

"In the Nicola Valley section of the Coast district the Middlesboro colliery, which was only opened last year, has this year shipped 26,000 tons of coal, and its output might have been doubled with more favorable freight rates to the Coast."

"On Vancouver Island, the Fiddick colliery, also opened last year, has produced 17,000 tons of coal, chiefly from development workings, and next year, when it will have its own railway to salt water and shipping facilities, its output will be much greater. Two other collieries on the island made small shipments, viz., the Gilfillan and New East Wellington collieries, but these have not as yet become important factors in the coal output.\*

"The available supply of coal in the Province seems to be unlimited, particularly in the Rocky Mountain coal field, in which might be included several coal mines in Alberta, just over the provincial borders, and it would seem that the Province controls the coal situation of the whole Pacific Coast, since the quality of the coal found on the coast to the south of the international boundary line is admittedly of inferior quality."

"During the year about 37.5 per cent. of the total coal sold from British Columbia mines was exported to the United States; the export trade to other countries was insignificant, having been less than 2 per cent. of the total sales. The collieries of the East Kootenay District exported to the United States about 57 per cent. of the coal they sold, while the coast collieries exported to that country about 30 per cent. of theirs. Formerly, in 1902, the coast collieries exported to the United States 75 per cent. of their coal, but the percentage exported since then has been gradually diminishing, owing to an increasing home market and to the use in California of crude oil as fuel."

#### Alaska a Probable Competitor.

It must be expected that ere long Alaska will become a competitor with British Columbia for the coal trade of the Pacific Coast States, and this is already recognized by those familiar with the extent and the promising nature of the coal fields already discovered in that country, in some of which there is coal in considerable quantity and of superior quality. The following significant reference to these fields is made in the "Mineral Resources of the United States" (Part II., p. 95): "The Alaskan coal fields, particularly those carrying a high-grade fuel, like the Controller Bay and Matanuska, are destined to play an important part in the advancement of industry on the entire Pacific seaboard of the North American continent. Their early opening up is a vital question to all residents on the Pacific." It is, therefore, apparent that Alaskan coal, as well as Californian fuel oil, may be expected ere long to curtail seriously the market for British Columbia coal on the Pacific Coast, hence the greater necessity for the advocacy by Canadians of the removal of all trade restrictions.

#### Coal in East Kootenay and Alberta.

Turning now to the Crow's Nest Pass coal field, and to other large areas northward and eastward, respec-

\*Note.—The Provincial Mineralogist also mentions, on pp. 198-9, a number of "prospective coal mines," of which the following is a summary: In East Kootenay, on the upper Elk River and Flathead River; in Similkameen, near Princeton, and on Granite Creek and Collins Gulch; in Nicola Valley; on Vancouver Island and neighboring islands in the Straits of Georgia; and in Skeena District, on Telkwa, Zymoetz, and upper Skeena Rivers. Then, too, there are occurrences of coal on Graham Island, of the Queen Charlotte group, while coal is reported as also having been found in the Peace River country, within the Boundaries of British Columbia.

tively, from that very important field, the following notes are submitted. While comparatively little is yet definitely known about coal in the Flathead section of Southeast Kootenay, the position is somewhat different concerning the country extending 100 miles north of that in which the producing mines of the Crow's Nest Pass are situated. In the vicinity of the upper Elk and Fording Rivers, including the area known as the Green Hills field, prospecting has disclosed the occurrence in these localities of much workable coal, which is only awaiting the provision of railway transportation facilities to make it available for marketing. In regard to size of seams and quality of coal, this part of the Province promises to take a leading position whenever the utilization of its immense coal resources shall be undertaken. In the Alberta extension of this field and, as well, southward from present collieries having connection with the Crow's Nest Railway, there are coal measures that, in many places, give promise of proving productive. About Lethbridge, in the prairie country, too, there is much coal, to work which more extensively old collieries are being provided with modern mining and handling equipment, and new enterprises are being established. And for much of the coal—probably for by far the greater part of it—a market will have to be found south of the international boundary line. So here, too, the question of reciprocity in coal will soon become a very important one.

The very large area of the fields and the enormous quantity of coal they are estimated to contain are probably not known to the general public. For the "Mineral Industry" (to the end of 1908, p. 200) the late Dr. George M. Dawson, for some years prior to his death the Director of the Geological Survey of Canada, wrote: "This (Crow's Nest) coal field, although it has not yet been fully defined, must have an area of at least a couple of hundred square miles. . . . It is already manifest that we have here one of the most remarkable coal basins known. Dr. Selwyn roughly estimated the coal underlying each square mile, in one part of the field, at 49,952,000 tons." (Annual Report, Geological Survey, Vol. V., N.S., p. 14 A.)

Later explorations by the Geological Survey have led to the discovery of other very important occurrences of coal, situated approximately 200 miles north of the Crow's Nest area. Of certain localities in the Cascade basin, D. B. Dowling, also of the Geological Survey, said recently (see "Summary Report of the Geological Survey, 1908," p. 79): "The number of seams discovered, as well as the undisturbed position of the measures, assures a very large total of mineable coal. . . . Assuming that where the whole thickness of measures is present there is an average of 90 feet of coal capable of being mined, the available coal amounts to 150,000 tons to the acre, or 90,000,000 tons to the square mile. For the average of the area as mapped, allowing for dirty seams and coal left in the mine, approximately 65,000,000 tons should not be an excessive estimate."

In further indication of the enormous quantity of coal available in this part of Canada, it may be mentioned that Mr. Dowling, in a report published by the German Development Company, Limited, of Ottawa, Ontario, gave as his estimate of tonnage of coal contained in three areas selected for the company, that so far as prospected, it would "show at the very least a total of 279,000,000 of tons," and in the same company's Kananaskis area his approximation was about 500,000,000 tons, while Mr. James McEvoy, formerly of the Geological Survey, estimated the last-mentioned area to contain "519,750,000 tons, of which 75 per cent. can

be actually taken out, or 4,000 tons a day for over 320 years."

Mr. McEvoy's estimate of coal in the German Development Company's Bighorn area, in Alberta, is 124,618,000 tons, of which 85 per cent. can be actually taken out—nearly 106,000,000 tons, or 2,000 tons a day for more than 175 years. For its Brazeau area, in the same province, he estimates a total of 198,000,000 tons, 85 per cent. of which 168,300,000 tons or say 4,000 tons a day for more than 140 years, can be extracted.

The foregoing estimates are here quoted with the object of giving some idea of the enormous quantities of coal available in the parts of Western Canada mentioned, not as in any way showing the total extent of the coal resources of this part of the Dominion. They should serve, too, to impress those who read them with some conception of the importance to Western Canada of securing, if possible, reciprocity in coal. In this connection, that is, as regards area of coal lands, it may be of interest to point out that in a bulletin published by the United States Geological Survey it is stated (after mentioning an area of about 484 square miles in Eastern Pennsylvania, and two small areas in the Rocky Mountain region underlain by anthracite coal), noting the several bituminous fields in the United States, that: "By far the most important of these in production is the Appalachian field, which includes the areas in Western Pennsylvania, and in Ohio, Maryland, Virginia, West Virginia, Eastern Tennessee and Kentucky, Georgia, and Alabama. In this region an area of 70,807 square miles is underlain by coal. Next in importance is the Central field, which comprises 58,000 square miles. The western coal field, the third in productive importance, contains 94,076 square miles. The Rocky Mountain field is the largest in area, comprising more than 100,000 square miles."

#### Reciprocity from Different Points of View.

Naturally, this question is unfavourably or favourably viewed, according to the effect reciprocity in coal would have upon the various interests directly concerned. In its "Coal Trade Review" of June 26, the New York "Engineering and Mining Journal" (p. 1309) stated the position fairly correctly in comparatively few words. It said:

"Many Pennsylvania shippers favour such an arrangement because they have a large trade with Canada; but West Virginia men are opposed because they are cultivating the New England trade, and do not want to come into competition with Nova Scotia coal. A similar local division exists in Canada itself. Nova Scotia miners are opposed to reciprocity, fearing to lose Canadian trade; Ontario favours it as a means of getting cheaper coal; while British Columbia also favours it owing to its large trade on the Pacific Coast." The last statement presents the case only in part, for of 567,274 long tons of coal and 37,314 tons of coke exported from British Columbia to the United States in 1908, 266,829 tons of coke were shipped to that country from the Crow's Nest Pass district, and none of this latter went to U. S. Pacific Coast points. The big market for coal and coke from Southeastern British Columbia and Southern Alberta will in the future be in Eastern Washington, Idaho, and Montana. It is quite probable exports to the Northwestern States of coal and coke from the Canadian fields just mentioned will steadily increase from now on, especially after additional railway connections shall have been established, as they most assuredly will be ere long. Reciprocity or no reciprocity, more Western Canadian coal and coke will find

a market in the states named, and this for two chief reasons—one, it will be the most accessible source of supply, and, two, the quality of fuel obtainable is excellent and probably better than from other fields seeking to supply the same market.

It is not the purpose of the writer to present here at length the views of those who are opposed to reciprocity from the standpoint of the coal mine operators of the Maritime Provinces. Only brief reference will be made to two published press despatches, both from Montreal, dated March 18, 1909. One was to the Toronto "Globe," and purported to give the view of the Dominion Coal Company, which was, in substance, that owing to labor costs being 50 per cent. higher at Cape Breton coal mines than at those of West Virginia, the former could not compete with the latter in the New England markets; further, that it would take the Dominion Coal Company at least three years to provide adequate terminal facilities at Boston and elsewhere, by which to handle the New England coal trade, and that the New England markets must be absolutely assured to the Dominion Coal Company for at least 20 years, or its losses on its St. Lawrence investments and the large outlay requisite in New England ports would together ruin its credit. Now, it does not necessarily follow that the whole of the St. Lawrence trade would be lost to the Dominion Coal Company, even if reciprocity were arranged. The statements of a Dominion Coal Company official made about two years ago (see "Journal of the Mining Society of Nova Scotia," pp. 92-95) may be regarded as throwing some light on this question. Space restrictions prevent these being here quoted in full, so only two will be reprinted: "We are selling coal in Montreal to the Grand Trunk and Canadian Pacific Railways at \$2.75 delivered. . . . We can discharge coal in Montreal at the rate of 1,000 tons an hour at a cost of less than 10 cents a ton." The whole discussion, as printed in the journal mentioned, is, however, of much interest at this time.

The second news despatch now under notice appeared in the Vancouver, B.C., "News-Advertiser," and it was represented to be the views of F.L. Wanklyn, vice-president of the Dominion Coal Company, as stated to the Montreal "Star," and of W.E. Muir, local sales manager of the Nova Scotia Coal and Steel Company. Both gave various reasons against reciprocity. The former was represented to have said that "if reciprocity were established it would only be a short time before the whole of Canada would be flooded with American coal, and the Canadian production would be extinguished," and the latter was strongly of the opinion that reciprocity would soon completely destroy the Canadian coal-producing industry. It may be that the statements of those gentlemen were not nearly so comprehensive as alleged; possibly they said "of the maritime provinces," not "of the whole of Canada." But if the latter, well, they may well be reminded of the now historic utterances of certain other persons who are known as "the tailors of Tooley Street." It does not appear to be a rash prophecy to assert that in the course of a very few years more coal will be produced in western Canada than in eastern, and that the proportion will steadily grow in favour of the west.

In contrast to the alarmist opinions of the gentlemen just quoted may be placed these of Mr. D.D. Mann, the well-known railway builder, who said in Victoria, B.C., two months ago: "I cannot, at the moment, think of any considerable manufacturing advantage that would be sacrificed by a readjustment of the coal tariff. There are some conditions surrounding the mechanical pro-

duction of coal in Nova Scotia which would, I think, adjust themselves by the opening of the New England market. I have reason to know that the Pennsylvania coal interests would not object to the change. What they would lose in Boston they would gain in Montreal and Ontario. For, let this be observed—the present tax on United States coal hits the consumer back of lakes Ontario and Erie, even though he cannot possibly buy other than Pennsylvania coal. Undoubtedly the duty restricts the consumption. Remove it and the consumption would increase. On the other side of the continent similar conditions prevail. There is unlimited coal in British Columbia and Alberta, and very little and that of poor quality, in the Pacific States. A duty on Canadian coal is a tax upon industry in the near-by states, without any compensating advantage to either side of the line. A glance at the map of the North America will show, I think, that the providential distribution of coal is such that it might wisely be left to work out its own solution of supply and demand. In any case, the ultimate disposal of it will be determined, not by the accidents of any tariff, but by how long the supply endures."

Before turning to western Canadian opinion, it may here be mentioned that readers of the Canadian Mining Journal will already have been made familiar with opposing eastern views as stated in its special correspondence from Glace Bay, N.S., published on May 15 and the letter of the secretary of the Free Coal League, which was printed in its issue of July 1.

#### From the Western Standpoint.

The following editorial comment on "What Free Coal Would Mean," appeared in "The Evening Post," Victoria, B.C., on April 14, last. The writer, Wm. Blakemore, is a coal mining engineer well known in eastern Canada as well as in the West. He wrote:

"Up to a week ago, it was considered there was an excellent chance of securing reciprocity in coal with the United States, but at the last moment the deal slipped up, and for another indeterminate period coal remains on the dutiable list, with a few cents' reduction only. The subject is not likely to become a live issue for several years, at any rate, although it is probable that conditions will force it to the front before the next general revision of the tariff. The real reason the advocates of free coal were defeated is because Canada stood to get the best of the bargain, and that was sufficient to enable the big coal operators of Pennsylvania and Ohio to kill the proposal.

"The natural conditions governing the interchange of bituminous coal between the two countries are somewhat peculiar. Canada has a large coal field in Nova Scotia, producing, in round figures, 6,500,000 tons a year. Between the Maritime Provinces, and almost to the Rockies, there are no deposits of bituminous coal; but in Western Alberta and British Columbia there is a production which has rapidly increased during the last ten years until it now approximates 5,500,000 tons. The total exportation of Canadian coal in 1908 is estimated at a little less than 2,000,000 tons, showing that 9,000,000 tons of native product is consumed within our own borders. The geographical position of the two great producing centres, upon the Atlantic and Pacific Coasts, imposes a limit upon the area within which it is economically possible to distribute the product; that limit may be placed at Montreal with reference to the Nova Scotia coal, and at Winnipeg for the Western. Between these points, distant nearly 2,000 miles, and including the whole of

the populous Province of Ontario, the market is supplied exclusively by American coal, which was imported during 1908 to the extent of 7,500,000 tons.

"The crux of the question depends on the extent to which distribution will be affected by the abolition of the 67-cent-duty. According to expert opinion, it could only work to the advantage of the Dominion, because natural conditions have determined that American coal must dominate the central district described, duty or no duty, and free coal would not increase the consumption within that area faster than would result in any event from the ordinary increase in population.

"In Nova Scotia, which already exports about 1,000,000 tons a year to the New England States, it is estimated that free coal would enlarge the market to the extent of at least half the consumption of those states; this would mean practically doubling the present production, and absorbing that much of the territory now served by the American producers. British Columbia and Alberta export, in round figures, 1,000,000 tons a year, and would export a great deal more, even in face of the duty, with better development, and increased transportation facilities. With the duty removed, the market for this coal would be extended a radius of at least 100 miles, and would yield a practical monopoly of the great smelting centres in Montana and Washington, to the Canadian product. Just what tonnage this would represent it is difficult to estimate, but since there is no high class coal in any of the Western States, the mere question of quality would carry the Canadian product into every market within, say, 600 miles of the International Boundary line. The tonnage consumed in such a vast district for smelting, steaming, and domestic purposes, already approximates to 10,000,000 tons a year, and is increasing by leaps and bounds. From this it will be seen that Canada has everything to gain and nothing to lose, by agreeing to reciprocal coal, but the beneficent project was defeated on both sides of the line by wealthy coal operators, who, not for the first time, have been able to impose their wishes upon the legislatures of both countries. The action of the American Senate has saved the Canadian Government from sharing the odium of the decision, but the more the people of Canada, and of the United States, study the question, the more they will realize the injustice of continuing a system which imposes an unnecessary tax upon one of the prime necessities of life. The protection of vested interests does not require a duty on coal, and the point will be reached when the public interests, clashing with that of the great Eastern coal operators in both countries, will force them to yield to the popular demand."

About two months ago J.D. Hurd, general manager of the Crow's Nest Pass Coal Company (which, by the way is not seeking customers for its coal, being unable to supply all demands made upon it, and having a prospect of continuance of a similar condition for some time to come) was interviewed in Victoria, B.C., by a representative of the "Colonist," which quoted him as having said relative to the proposed reciprocal arrangements:

"I think such an arrangement would work out to the best interest of the operators and consumer throughout Canada and the United States.

"Some years ago I was connected with the coal mining industry in Ohio, and at that time we shipped a large quantity of our product to Ontario and Manitoba. Such an arrangement would certainly be in the interests of Central Canada for there are no Canadian mines which would be affected by the free entry of

coal into that district. About 1896, I investigated the condition of the coal industry in Cape Breton and Nova Scotia generally. At that time the Dominion Coal Company was controlled by H.M. Whitney, of Boston, and he was seeking to obtain the free entry of coal into New England, largely in connection with his Bay State Gas company. But the fact remains that the natural market for a great deal of the coal of Nova Scotia is the New England States. The Nova Scotia coal is of a somewhat lower grade than that shipped to the coast by Pennsylvania and other centres and is used for different purposes. The free entry should not only benefit the Canadian shippers but the American consumers.

"The Nova Scotia consumers are somewhat jealous of their St. Lawrence market, but, as a matter of fact, I do not think that taking the duty off the American coal entering Canada at that point would affect them to any degree. More coal would enter, but it would merely be due to the increased industry in the lines using that class of the product.

"Here in British Columbia, while the proposition is a different one, it comes to the same thing. There are coal mines in Washington and Montana, but these are for the most part owned by different railway companies, such as the Great Northern, the Northern Pacific, the Union Pacific, and so on, and there will never be any individual producers of any great volume of coal for market. The railways use all the coal they mine, and will use more with the increase of traffic. The ordinary consumer must use British Columbia coal, and that is the outlet for our surplus product.

"With the duty removed and British Columbia coal going into the United States free, it will mean that the coal areas of the province will be developed more widely and the output will increase. It cannot militate against the local consumer. The rates will not go up. With increased production, the cost of that production is lowered and the consumer reaps part of that benefit. Any short-sighted policy, such as attempting to set an arbitrary, high price on coal works out its own solution, especially in a country with the vast undeveloped areas of British Columbia. Reciprocity would be a good thing for the consumers and the operators, both in Canada and the United States."

Representatives of the two coal mining companies who have for many years been operating on a large scale on Vancouver Island, and whose chief market has heretofore been San Francisco, California, were interviewed last March by newspaper representatives. A despatch received in Victoria at that time from Nanaimo, where the company's general manager, Thos. R. Stockett, has his headquarters, was as under:

"The management of the Western Fuel Company, interviewed regarding the possibility of the removal of import duties on coal passing between Canada and the States said that they believed that reciprocity in coal between the States and Canada would be a good thing for both countries. So far as British Columbia is concerned, it would tend to extend the field in the States where its coal could be marketed and inasmuch as there is no American coal imported into British Columbia, the removal of the duty by Canada could not have any effect on any of the existing industries here and particularly as British Columbia coals are of a high standard.

"The Western Fuel Company has been making a specialty of developing trade in British Columbia and is now marketing fully 65 per cent. of its output in this province. But in order to keep its mines working to

capacity it is obliged at present to seek any outlet in other countries and in the States is the only field available. The Company will welcome the day when its entire output can be marketed in British Columbia."

J.A. Lindsay, of Victoria, treasurer of the Wellington Colliery Company, who has been intimately associated with the Dunsmuirs in this and other large coal mining enterprises for years, said to the "Colonist":

"The consumer in either country would reap the benefit of the abolition of the duty on coal by Canada and the United States.

"So far the details received from Washington giving the terms of the measure as it applies to coal are too meagre to venture any very lengthy opinion upon the matter. The removal of the duty on coal imported into the United States would have the effect of stimulating the production of coal in the interior and on this coast. It would mean probably that new coal measures would have to be opened here and provide work for more men. It would also mean cheaper coal for the consumer in California, and that many people there who now use oil for fuel would return to the use of coal. The prices of the two products have gradually equalized themselves. The removal of the duty on coal entering the United States would not, I believe, increase the cost of coal to the consumer in this province. It would simply mean that more coal would be mined.

"On the other hand the removal of the duty on American coal entering Canada would prove a great boon to the Canadian consumer upon the prairies, in Ontario and in Quebec. Nearly all the coal used there is brought from the United States, from Pennsylvania and Virginia.

"The Nova Scotian producers have generally opposed the proposal to abolish the duty on coal entering Canada. It is difficult, however, to understand their point of view. They export a large quantity of coal to the New England States and little of their product is used in Upper Canada. They would benefit immensely more under the reciprocal arrangement, I should think, than they would suffer.

"The coal fields of Canada and the United States are not active competitors. Nature has placed coal on this coast and none in California; coal in the Crow's Nest district, none in the rich copper mining camps to the immediate south of that district; coal in Pennsylvania and none in the central provinces of Canada; and coal in the Maritime Provinces and none in the New England States. The conclusion is obvious. Free interchange must benefit the consumer since it will tend to reduce the cost of production and as well, the cost to the consumer."

As coal mine owners in Western Canada are believed to be unanimous in the opinion that reciprocity in coal would greatly benefit the coal mining industry of the West, there does not appear to be any present necessity to seek the views of others than those quoted, especially, as the latter are representative of the largest operators in the two chief coal producing districts of British Columbia, the Crow's Nest Pass and Vancouver Island, respectively. It is known that at least one operator in the adjoining State of Washington has expressed himself favourably towards reciprocity, but it must be expected that most of the mine owners in that State selling coal to the public will support continuance of the existing duty, especially in the admitted circumstance that British Columbia coal is of much better quality than the bulk of that mined in Washington.

Eastern Washington and Idaho, on the other hand, will co-operate to secure the removal of customs duty

on coal, for they look to the Crow's Nest Pass mines; and those of the adjacent parts of Alberta for their chief supply of coal. In this connection it may be noted that James J. Hill, chairman of the board of directors of the Great Northern Railway, addressing a number of the business men of Spokane, a city of about 100,000 people and the inland capital of the State of Washington, said to them last November: "One of Spokane's greatest needs is cheap coal. There are no extensive coal fields nearer than British Columbia. Coal coming into the United States carries a duty of 67 cents a ton. Get that removed and good domestic coal can be delivered in Spokane in carload lots for less than \$5 per ton. It should be retailed at \$1 profit, which would make coal here \$6. Cheaper coal than at present is absolutely necessary for the development of manufacturing. Spokane is getting too big to burn pine slabs."

Much similar advocacy of reciprocal arrangements for free coal might be added, but more than enough has been written and quoted to indicate that, far from being disposed of by the recent decision of the United States legislature to maintain a comparatively high duty on coal, the question has not yet been widely nor actively taken up. It is hoped the foregoing information will in some measure prove of service to those who shall sooner or later undertake a persistent campaign in favour of free coal for both Canada and the United States.

#### THE BRITISH MINT ANNUAL REPORT.

The thirty-ninth annual report of the Deputy-Master and Comptroller of the Mint for the year 1908 was published on July 7th.

It sets forth that the demands for Imperial coins exhibited a considerable decline. About 92 millions of such coins were struck, a fall of over 36 millions from 1907. The number of coins struck for colonies showed an increase over the previous year. In all nearly 126½ million pieces were struck in the operative department, of the value of 15½ million pounds.

Gold bullion, weighing 2,171,962,178 ozs standard, of the value of £8,457,077 14s 7d, was imported into the Mint for coinage during the year. The value of light gold coin received for recoinage was £3,300,000, and its weight 838,463,890 ozs.

The gold coin issued during the year was as follows: Sovereigns, £12,600,000; half-sovereigns, £2,000,000—total, £14,600,000.

New gold coin was received at the Bank of England from Australia during 1908 amounting to £593,150. The total amount of light gold coin received from the Bank of England during the year was £3,300,000.

The gold coins received and weighed at the Bank of England during the year amounted to 54,553,704 pieces, as compared with 53,233,708 in 1907, and the percentage of light, both in sovereigns and half sovereigns, the latter more particularly, was higher than in the previous year. The increase in the amounts of sovereigns accepted as light still continues, and the large number of half sovereigns withdrawn in 1907 and 1908, due to the large issues made in 1892-1893, is in accordance with expectation.

The silver coin issued during the year amounted to £815,397 (exclusive of Maundy money) as against a total of £2,019,471 in 1907. The denominations of the silver coinage were half-crowns, 210,020; florins, 266,850; shillings, 142,342; sixpences, 117,170; threepenny pieces, 79,015.

The total number of silver coins issued during the year (excluding Maundy money) was 18,203,500, as against 37,255,570 in 1907. Of these the number issued for circulation in the United Kingdom was 7,155,200, comprising 2,969,360 of the larger denominations (2s 6d, 2s), and 4,185,840 of the smaller (1s, 6d, 3d), or 41.50 and 58.50 per cent. respectively.

The issue of Imperial bronze coin in 1908 reached the total of £155,580, a falling off of \$71,970 from the large issue of the previous year. Particulars of each denomination issued are given below:—

| Denominations.      | Wt. (tons). | No. of pieces. | Value.   |
|---------------------|-------------|----------------|----------|
| Pence . . . . .     | 282.2       | 30,345,600     | £126,440 |
| Halfpence . . . . . | 64.9        | 11,644,800     | 24,260   |
| Farthings . . . . . | 13.1        | 4,684,800      | 4,880    |
| Totals . . . . .    | 360.2       | 46,675,200     | £155,580 |

The amount issued in the United Kingdom, £138,135, was distributed as follows: £510 to the Bank of England, £45,545 to London applicants and £92,030 to the provinces. The shipments to the colonies amounted to a total of £17,445. The smaller issues are accounted for by the contraction in trade.

### CANADIAN PATENTS.

Below will be found a list of patents issued by the Canadian Patent Office on July 6th, 1909, relating to mining and metallurgy, and furnished by Fetherstonhaugh & Co., Ottawa, Russell S. Smart, Resident.

119220. W. Scheurmann, Newark-on-Trent, England, air and gas pumps.

119222. J. J. Manning, J. W. Stephenson, Toledo, Ohio, methods of making castings, National Malleable Castings Co.

119,240. A. G. Betts, Troy, N.Y., processes of treating arsenical ores and speisses.

119257. J. C. Clancy, N.Y., treatment of ores bearing precious metals.

119259. W. H. Connell, Pittsburg, Pa., manufacture of compound ingots.

119260. T. H. Crittall, Bramtree, Essex, Eng., machinery for manufacturing expanded metal.

119282. E. W. Wynne, Liverpool, Eng., refining petroleum oil.

119321. D. W. Rowlands, Minersville, Pa., drills.

Below will be found a list of patents issued by the Canadian Patent Office on June 29th, 1909, relating to mining and metallurgy, and furnished by Fetherstonhaugh & Co., Ottawa, Russell S. Smart, Resident.

119107. W. H. Robson and H. J. Stobart, Stafford, Eng., vapour burners, The Chance Bros., Ltd.

119109. J. Noad, East Ham, Essex, Eng., the treatment of hydrocarbon oils and the like for the production of volatile spirit, Patent Hydrocarbon, Ltd., London, Eng.

119110. C. T. Snedeker, Chicago, Ill., processes for softening mineral bearing ores, C. T. Snedeker, W. E. Fry.

11958. G. L. Fogler, Pittsburg, Pa., processes of reducing ores, Fogler Heat & Reduction Co.

119184. Solomon Frank, Frankfort-on-the-Main, Germany, methods of treating zinc.

119188. H. H. Hughes, Springfield, Mo., revolving furnaces for volatilizing ores.

119192. J. F. Monnot, New York City, apparatus for producing compound metal bodies.

### GOVERNMENT VALUATION OF COAL LANDS.

In the year 1906 the United States Government withdrew from sale 66,000,000 acres of public coal lands. Previous to that year such lands had been sold for \$10 or \$20 an acre, according to their distance from a railroad. A presidential order provided that henceforward coal lands should be classified and evaluated by the U. S. Geological Survey.

The scheme of valuation determined by the Survey is as follows: Anthracite and coking bituminous coals are valued at 2 to 3 cents per ton. High-grade non-coking coals are valued at 1 to 2 cents per ton. High-grade sub-bituminous and low-grade bituminous coals are valued at ½ to 1 cent per ton. Low-grade sub-bituminous coals and lignites are valued at the minimum price fixed by law—\$10 and \$20 per acre. The tonnage is conservatively estimated at figures that should always be exceeded by actual recovery.

Provision is made whereby the price of coal lands may be increased for special reasons.

## BOOK REVIEWS.

**Handbook for Field Geologists.** By C. W. Hayes, Ph.D., Chief Geologist, United States Geological Survey. Second edition, thoroughly revised, 150 pages, 18 figures. Morocco, \$1.50 net (6 6 net). John Wiley & Sons, New York—Renouf Publishing Co., 61 Union Avenue, Montreal, 1909.

As Dr. Hayes puts it, this book is intended "to insure thoroughness and system, not to relieve the observer of the necessity for thought."

Part I., entitled "General Instructions," is a précis of the requirements, preparations, equipment, and methods of field geology.

Referring to the qualifications that a field geologist should possess, Dr. Hayes writes thus: "The first qualification is a good physique and a strong constitution. . . . The second is adaptability. Few occupations

present so wide a diversity in conditions under which work must be carried on. . . . His surroundings may vary all the way from the luxuries of a summer resort hotel to the bare necessities that he can pack on his back, and he must be able to adapt himself with equal readiness to either extreme. . . . A geologist must possess a practical knowledge of horsemanship, of boating, and of general woodcraft, so that he will be equally at home in the saddle, in the canoe, or on foot in a trackless forest."

Special academic training is also a necessity. Dr. Hayes defines geology, not as a special science, but as the application of a number of special sciences to the solution of a particular class of problems. The best preparation, therefore, is a thorough grounding in the fundamental sciences, particularly chemistry, physics, zoology, and botany. Mathematics and modern languages are also essential.

"Second in importance only to a thorough grounding in the physical sciences," says Dr. Hayes, "is ability to write clear and concise English." Here we can hardly agree with the author. Surely ability to write well in English is as essential, if not more essential, than any other requirement.

Good advice is given on page 5, touching the relation of the geologist to the public. It is generally advisable to take the necessary time and trouble to explain to any one making serious inquiry exactly what is the object of the work. . . . The opportunity to educate the people of a region in which work is being done to an appreciation of the nature and importance of geologic surveys should be utilized so far as possible."

Preparation for field work is next touched upon. General directions for attacking different kinds of field work are given. Next, the field output is inventoried. This section is practical and instructive. The mint ration adopted officially by the U. S. Geological Survey is printed in full. Field observations, measurements of various kinds, determination of faults, are described and illustrated. Methods of making field notes, sketches, traverse notes, and so on, and directions as to the use of chemical analyses, mine surveys, and mineral collections, are noted fully.

In Part II., after general summaries of field observations to be made by the geologist in igneous, sedimentary, and metamorphic rocks, on structural geology, on glacial deposits, and on oil and gas fields, twelve exhaustive schedules appear. These are intended to guide the geologist in securing completeness and system in making and recording observations. The first four schedules have to do with pure geology, the remainder with applied geology. Together they constitute an invaluable guide, the matured result of experience and discussion.

An appendix contains a list of official surveys relating to all parts of North America.

Seldom has it been our good fortune to review so useful a little volume as this "Handbook for Field Geologists." Its usefulness should not be confined to professional geologists. It should be in the hands of all mining men and all investors. It would thus become an invaluable link between the public and that much-misunderstood person, the field-geologist.

**Through the Yukon and Alaska.** By T. A. Rickard, Editor of the Mining and Scientific Press and The Mining Magazine. 175 illustrations, \$2.50 postpaid. Mining and Scientific Press, 667 Howard Street, San Francisco, 1909.

This is the record of a journey through Yukon Territory and the District of Alaska during the summer of 1908, of "the pleasures and tribulations of a voyage of 8,250 miles, in the course of which 18 different vessels were boarded, and 18 different kinds of canned vegetables were broached."

The volume is dedicated charmingly and touchingly to Mr. Rickard's small son, John. We shall not refrain from quoting the last verse:—

"God give you grace and make you strong  
To rise above all meaner things;  
And be your life as sweet a song  
As that your mother sings."

Written for the general reader, "Through the Yukon and Alaska" is non-technical throughout. Nevertheless, its pages are profitable for technical and non-

technical readers alike. Interesting bits of history are interwoven through the narrative. The reader is treated to vivid descriptions of scenery, mining camps, living conditions, river travel, and all the distinctive features of existence in the far North. The author's direct, vivid, nervous style carries us swingingly from chapter to chapter. Every chapter gives fresh evidence that Mr. Rickard enjoyed the journey hugely, and every chapter is superbly vital.

A lesser man, we doubt not, filled to supersaturation with the charm and majesty of the North, would exude superlatives and dithyrambs. But Mr. Rickard, barring one or two flights into rhetoric, has held himself well in hand.

In manner, matter, and arrangement "Through the Yukon and Alaska" is the best of Mr. Rickard's literary offspring. It possesses coherence. It shows evidence of sustained care and shrewd workmanship. The author's style is not exuberant; neither is it meagre. Nor is it studiously balanced. It is simply and spontaneously natural—the pleasant product of good taste, keen observation, and enthusiasm.

**The Canadian Annual Review of Public Affairs—1908—**  
by J. Castell Hopkins.. Eighth year of issue—illustrated—The Annual Review Publishing Company,  
Toronto—1909.

This volume is an improvement upon its predecessors. Dominion public affairs are interestingly sketched. Political movements, provincial developments, transportation interests, financial and insurance conditions, literature, journalism, art, and many incidental of the year are treated.

Considerable space is assigned to the mining industry. This we are glad to note.

As a summary of the history of Canada for the past year, Mr. Hopkins' volume has a distinct place. It should be read by everyone.

#### PERSONAL AND GENERAL.

Messrs, Moore and Scollan have opened an office at 43 King St. W., Toronto, for the purpose of carrying on their business as power engineers.

Mr. S. B. Belden has been promoted to the position of Sales Manager in the Mining Machinery Department of The Jeffrey Mfg. Co. with headquarters at Columbus, O. Mr. Belden, who has for a great many years been manager of the Pittsburg Office of the Jeffrey Company, succeeds in this position Mr. R. G. Hutchins, Vice-President, whose resignation has recently been accepted.

The following appointments have been made to the Staff of the Nova Scotia Technical College, Halifax, N. S. :

To be Professor of Civil Engineering: Mr. T. S. Hewerdine, A. B., S. B., C. E., University of Illinois. '04, Professor of Mathematics and Civil Engineering at McKendree College, Lebanon, Illinois.

To be Professor of Electrical Engineering : Mr. R. R. Keely, E. E., M. M.E., Cornell, '00, for the past three years Chief Engineer of the City of Edmonton, Alberta.

To be Instructor in Mining and Metallurgy: Gerald F. Murphy, B.Ce., in Mining Engineering, Dalhousie College, Halifax, who, for the past year, has been tak

ing a post graduate course in Mining at Columbus University, New York.

Mr. R. W. Brock, in a recent paper before the Canadian Mining Institute, emphasizes the need of a connecting link between the prospector and the purchaser, and advocates the filing of statements by the staker, corroborated by an assayer or engineer at mining recorders' offices, local institutes and boards of trade. All of this should be arranged on some scheme to avoid expense to the prospector. Where there is an opening some firm will soon seize the opportunity, and this has been done by "Mines Inspection, Limited." They have started their career with the Gowganda camp, making reliable reports, not only affording capital a systematic means of doing business, but also helping the prospector with advice as to the value of his property, and helping to develop his claims. It can readily be seen that the benefit that will accrue to the company will be the information thus gathered. At present they are contracting for mining work, and are selling claims, thus meeting their current expenses.

## Correspondence.

Editor Canadian Mining Journal:

Sir,—In your issue of May 15th last you give a summary of coal mining in Alberta for the year 1908, and, doubtless unintentionally, your correspondent has omitted even mentioning "The Edmonton Standard Coal Company, Limited," collieries at Edmonton. The same error occurred in the report in the "Mining and Metallurgical Industries of Canada" for 1907 and 1908, to which I called the attention of the Hon. W. Templeman, Minister of the Department of Mines at Ottawa, by letter dated March 31st, 1909, to the effect that on page 279 of the report of the "Coal Mining in Alberta" no reference whatever to the output of "The Edmonton Standard Coal Company, Limited," notwithstanding that the pay-roll for 1907 and 1908 amounted to over \$108,000, the largest pay-roll in the vicinity of Edmonton. The Hon. Minister made reply, regretting the omission, and enclosed a letter from Eugene Haanel, Director of Mines, dated Ottawa, April 2nd, 1909, regretting the mistake and assuring that it was unintentional, and enclosing a letter from Theo. Denis, who stated that the "name of the Edmonton Standard Coal Company, Limited, was omitted in the report on the mining and metallurgical industries of Canada through an oversight, and was attributable to a clerical error."

"Although I must own this is a serious one. The Edmonton Standard Coal Company, Limited, is one of the largest producers of the Edmonton district, and their predecessors, the City Coal Company, were among the first ones in that field to mine coal by means of a shaft, and for that reason alone deserve special mention."

Further: "That we are aware of the importance of the Stanard Coal Company is proved by the fact that it is included in our office list of 'Important Canadian Collieries,' and that a sample of several tons of their coal was collected last summer by an officer of the Mines Branch for the tests of Canadian coals now being carried on by us, and in the report of this work the Edomnton Standard Coal Company will figure with the other important coal mines of Canada."

There are two seams of coal on the company's property (which is the nearest colliery to Edmonton), a 5-foot and a 4-foot seam, which competent engineers

estimate to contain over five million tons. At the present time the company are operating the wider of the two seams, and are producing an average of 100 tons per day. The quality of the coal is superior to all other coal in the Edmonton district, and in a test of nine other mines competing for the city of Edmonton contract for power purposes the "Edmonton Standard" graded the highest, and was taken as a standard to grade the rest.

The contracts of the Provincial Government for public buildings, and the Edmonton School Board contracts and a portion of the city contract, have recently been awarded to the Edmonton Standard Coal Company, Limited, showing most conclusively, Mr. Editor, that it is one of the most important collieries at Edmonton.

I have no doubt you will give space in your valuable and well-edited Journal to correct the report regarding the coal mining in Alberta, and the injustice unintentionally done to "The Edmonton Standard Coal Company, Limited."

Yours truly,

H. MUNROE.

Sec.-Treas.

Editor Canadian Mining Journal:

Dear Sir,—In your issue of July 15th, you make mention of a new stope surveying instrument invented by Mr. Tonnesen, of the East Rand Proprietary Mines, Limited.

As a surveyor, I welcome anything which can lighten the burden of the unfortunate individual whose duty it is to measure stopes; but I must object to your statement that friction over such measurements was the main cause of the late strike on the Rand. It was dragged in, after the strike had begun, on various platforms as an additional grievance; but it never was a main issue.

The cause of the strike was the repatriation of the Chinese, whereby tens of thousands of labourers employed in stoping were withdrawn, and their places had necessarily to be taken by white men running rock drills, in the absence of native labour to replace the Chinese. To make the white man efficient enough to do this economically, it was necessary for him to run three or more rock drills, and this the miners refused to do; hence the strike.

It is worthy of note that this very same question of running three drills each caused strikes at two mines on each of which I was at the time surveyor, one on the Village Main Reef in 1902 and the other at the New Kleinfontein in 1905. In each case the miners were compelled to give in, and on going back to work found they could make far more money with three drills than with two, which up to that time had been the number supervised by each miner.

In laying the blame for the strike on the surveyors I think you are doing less than justice to a class of men who, while doing as a rule more work, and more disagreeable work, than anyone else engaged in the administration of mines, invariably come in for whatever kicks may be going around.

In all my experience as a mine surveyor I have invariably found that those men who "grouched" persistently at their measurement were the "never-sweats," the "born-tireds" and the wasters generally. I never met a really good rock drill men who grumbled, except in jest at the "— surveyor." I remain,

Yours truly,

J. D. RAMSAY.

### THE BIRTH OF AN IDEA.

Editor Canadian Mining Journal:

Sir,—In your issue of June 1st, under the heading of "Petroleum and Oils," you say: "Somehow we are led to believe that there may be a faint adumbration of truth in what Mr. Coste tells us." Pluck up your heart, Mr. Editor, and do not shrink back as if with pain from the thought that perhaps a new idea may enter in. If there are any theories of organic origin lodged in your brain, you are quite safe in casting them into the outer darkness where they belong. Take a trip down through the natural gas and oil fields of Ontario, and you will see that the organic theory is not worthy of even serious consideration. There are no carbonaceous strata from the surface down to the Archaean granite. There are no coal beds within hundreds of miles. Perhaps the gas was distilled from the coal of Ohio and migrated laterally like the Canada goose (*Branta Canadensis*) several hundred miles, in preference to escaping vertically through a thousand feet or so of rock. This theory may develop a difficult international question like the seal trouble in the Pacific Ocean. Our neighbours may claim that as the stuff had its birth or orig-

inated in their territory, it belongs to them. Down with the vegetarians or organists! Fiat lux.

Yours truly,

J. M. SLICKENSIDES.

The Editor:

Sir,—In your issue of July 15th, I note your item, "Buildings of the Badger Mine were totally destroyed by fire." I know that the item was published inadvertently, but it is misleading and unfortunate. We did lose our water tank and some of the old original log camp buildings. The new plant, which was erected this winter, was covered with galvanized iron, and, while we had a close call and are a little inconvenienced as a result of the fire, the actual loss is inconsequential, and we were able to resume our work as usual next day after the fire.

Yours truly,

BADGER MINES CO., LIMITED.

Per C. H. Bunker, Pres.

## INDUSTRIAL NOTES.

### WESTINGHOUSE ELECTRIC MINE INSTALLATIONS.

Among some recent notable installations of electrical machinery by the Westinghouse Electric & Manufacturing Company in the mining territory of several Western States there may be noted the following:—

The new blower-house of the Washoe Smelter of the Anaconda Copper Mining Company, at Anaconda, Mont., contains four 600 horsepower motors driving Root blowers, and two additional 600 horsepower slow-speed motors driving high-pressure air compressors for pneumatic-locomotive service.

The turbine plant of the Helena Power Transmission Company, Butte, Mont., is a Westinghouse installation. This supplies the local Butte mines in parallel with a 70,000-volt, 85-mile transmission line, and has performed some remarkable overload and emergency service.

The pumping station at the Leonard mine of the Boston & Mantana C. C. & S. M. Company, 1,200 feet underground, contains two 300 horsepower couples of two 150 horsepower motors, each direct-connected to Nordberg pumps and supplemented by a similar 150 horsepower motor driving an Aldrich pump. The station, 1,200 feet underground, is about 20 feet high, is lighted by arc lamps, and has a complete switchboard installation.

The semi-automatic relay-controlled hoist of the Modoc mine of the Anaconda Copper Mining Co., Butte, Mont., is also an interesting recent installation of the Westinghouse Company.

### THE BENNETT TUNNEL MACHINE.

This new tunnel machine, as will be seen from the accompanying cut, operates simultaneously a set of 48 air drills. It is claimed that the jar and recoil of the ordinary air-drill are completely done away with. Work is continuous. No explosives are used. The face

of a tunnel is drilled, broken, and cleared in one continuous operation. Space does not permit of a complete description of this ingenious contrivance. Further details will appear later.

Although apparently complicated, the machine is exceedingly simple in principle and operation. It is adjustable and flexible. Any number of drills can be

used up to the maximum. The power requirements for a 48-drill machine is 75 horsepower. One machine is being tried out successfully in Denver, Col.

Capt. A. H. Swarthout is the Canadian representative of the Ontario Bennett Tunnel Machine Co., Ltd. His headquarters are in Toronto.

The Westinghouse Electric & Manufacturing Company Pittsburg, Pa., has issued a handsomely printed little booklet describing the applications of its line of numerous illustrations scattered through the pages suggest many time and labor saving uses for these efficient little power devices; among these are the motor-driven adding machine, mailing machine, eraser, graphophone, envelope sealer, vacuum cleaner, buffing and polishing wheel, blower, sign-flasher, box-covering machine, hand drill, hack saw, coffee grinder, etc., applications selected at random from the large number

of uses where the electric motor provides the ideal power. The booklet, "Westinghouse Electric Motors for the Office, Store and Shop," will be sent on request.

W. F. Stanley & Co., Ltd., Great Turnstile, Holborn, London, W.C., are the manufacturers of Barnard's Co-ordinate spiral slide rule. They have just issued a book of instructions that is a complete guide to the use of this very necessary instrument. The user is able to perform with speed and accuracy, multiplication, division, proportion, continuous fractions, powers, roots, and logarithms. Moreover, the natural and logarithmic

values of trigonometrical functions of any angle can be determined with precision.

The Sullivan Machinery Company has installed a branch office at Australasia Chambers, Martin Place, Sydney, New South Wales, to further the sale of its air compressors, rock and diamond drills, coal cutters, etc., in the Australasian commonwealths. Its establishment is due to the growing importance of the mining industry in that field. The new office is in charge of Mr. Geo. R. Mair.

## SPECIAL CORRESPONDENCE

### NOVA SCOTIA.

**Glance Bay, July 20.—The Glance Bay Strike.**—It is scarcely a correct use of words to refer to the present labour troubles at Glance Bay as a "strike." The cessation of work by the adherents of the United Mine Workers, and the intimidation of hundreds of other men who wish to work, has not arisen out of the struggle of legitimate trade unionism against oppressive capitalism. It is not one incident out of the many that daily occur in the never-ending struggle of the proletariat against plutocracy that is as old as time and will still be waging when our civilization and our race is but a memory. Many of the deluded men who have gone on strike believe otherwise, and are honest in their belief, not realizing that they are the miserable victims of men whose mouths are filled with lies.

The Glance Bay trouble is but one of those struggles that will arise from time to time throughout this Dominion as each centre of industry and population has to decide whether Canada shall assimilate the stranger within her gates and make of him a law-abiding citizen of the Empire, or whether the stranger shall oust the sons of this young nation, and impose his customs upon us. It is strange that such a struggle should be centered in a portion of the Dominion where the people are known for their insularity and the tenacity of their opinions.

Probably there never was a strike in Canada that had less justification. The Dominion Coal Company are now dealing with the first strike in their history, and, in fact, there has only been one strike of any consequence in the coal mines of Cape Breton since 1868. The Canadian press, with the exception of one ephemeral and intermittent broadsheet that has made its appearance on perhaps a dozen occasions, has with one voice condemned the action of the United Mine Workers. Some provincial newspapers that have assiduously fanned the agitation for months past are now trying to lay the fire they have caused, much to the bewilderment of those simple people who believe what they read in the newspapers. All shades of public opinion, religious, political, and commercial, unite in deploring this strike as a national calamity. Nevertheless, a very large amount of misapprehension exists as to the true magnitude of the trouble. The vastness of the Dominion Coal Company's enterprise has so impressed itself on the public that it is assumed that any labour trouble that seriously affects its operations must have behind it the support of a large and determined body of men. This, however, is not the case. The United Mine Workers are in a decided minority of the Coal Company's employees, and their determination is a mixture of desperation and American money. At the end of the second week of the strike two-thirds of the Coal Company's employees are working, and many of them have risked and are risking their lives, voluntarily, to protect what they conceive to be their company's interests and their own. Before the strike the U. M. W. A. publicly announced in the newspapers that they were about to call out 95 per cent. of the Coal

Company's employees. On the first day of the strike the output of the company's mines was just about half a normal output, and the number of men that absented themselves was well under two thousand. Taking into consideration the number of men who were waiting to see how things would develop, it is safe to assume that the actual number of strikers did not exceed 1,700, which is generally supposed to be approximately the number of U. M. W. A. men in the Coal Company's employ. The day following was marked by disgraceful and riotous scenes. Men were beaten, stripped naked, assailed by the most opprobrious epithets imaginable, and things were said and done that deserve the most emphatic and sternest condemnation. As a result men were intimidated from coming to work, and we in Glance Bay witnessed the terrorizing of a community of ten or twelve thousand people by a body of persons who did not represent ten per cent. of the population.

The situation was not improved by the Mayor of Glance Bay, who applied a very extraordinary remedy for the amelioration of such intolerable conditions. This gentleman accepted the offer of the U. M. W. A. leaders to furnish him with a number of special constables to be sworn in to keep the peace, and a considerable number of the strikers were sworn in as special constables, in which position they played the dual role of pickets and policemen, a condition of affairs that has surely never been paralleled in any British municipality. The result of this peculiar civic action was such as might have been expected. These U. M. W. A. constables proceeded to arrest the special constables of the Coal Company, and the singular scene was several times witnessed of the Coal Company's officials being arrested and haled before a magistrate by some half-grown hobbledohoy clothed with a brief authority by the Chief Magistrate of the municipality. It was well that the populace saw the undoubted humour of the situation, otherwise it would have been intolerable. These appointments were after several days revoked by the Police Committee, upon which the Deputy Mayor and another councillor took upon themselves to re-make the appointments, which were speedily cancelled once more by the Police Committee. By this time no one knew how things stood, and the townspeople ceased to take any serious interest in the farce.

On the 7th of July it was seen that the civic authorities were utterly incapable of dealing with or appreciating the gravity of the situation, and following the refusal of the Mayor to ask for the protection of the active militia, the County Court Judge on the advice of the High Sheriff and the Warden of the county requisitioned the Department of Militia for the aid of the military, and they were sent from Halifax immediately. The presence of 500 soldiers has without doubt averted bloodshed and much destruction of property, and immediately after their arrival men commenced to report for work in increasing numbers. The outputs have crept up day by day, until they have

exceeded that obtained on the first day of the strike before the U. M. W. A. had introduced the little pleasantries which have rendered it necessary to have military protection.

The United Mine Workers have evidently a keen desire to control the mines of the Dominion Coal Company. At the Glace Bay Hotel, which during the past fortnight has provided rest and refreshments for the leaders of the opposing forces, and a horde of newspaper reporters, the U. M. W. A. have five of their officers from the United States, assisted by a clerical force of two female clerks and a male clerk. The business of these gentlemen in Cape Breton is to lead and supervise the campaign of an American labour union in its attack on one of the most important industries of Canada, in the attempt of a foreign union to usurp and destroy a Canadian union, which was in existence and was doing a good work many years before the U. M. W. A. had emerged from the womb of time. A gentleman prominent in American governmental circles, who has made a special study of industrial conditions on this continent, recently stated that the U. M. W. A. were very anxious to control the eastern mines of Canada in order to be able to neutralize them whenever a strike was considered necessary in the bituminous coal fields of the United States. This, and this only, is the reason for the presence of these U. M. W. A. gentlemen in Glace Bay. Their efforts will fail; must fail, in fact, because American domination in any shape is something that Canada will not tolerate. Annexation was once a live issue in the Dominion. It is now dead as Moses. Labour legislation and labour organization always lags a decade or two behind the general progress of our race, but when the time comes—and it is not far distant—when Canada chooses between international trade unionism, or, in other words, domination of Canadian unionism by that of the United States, and national trade unionism—when that time comes, the national spirit will assert itself. All attempts to dam back the rising tide of nationalism in the Dominion are futile, nay puerile, and remind one of Mrs. Partington and her broom. But these gentlemen do not care. They draw good fat pay for their efforts. The scale of U. M. W. A. relief in Cape Breton is \$2 per week per man, with \$1 for his wife and 50 cents for each child. This would just about liquidate the cost of one day's bed and board at the Glace Bay Hotel. When the strike has dragged out to its foregone conclusion these gentlemen will hie back to their own land, with undiminished paunches—and we may add, undiminished gall,—and will leave the poor victims of their campaign of falsehood to tighten their waist-belts and mourn their impaired finances.

The favourite expression used towards those men who are at work by the strikers is that of "scab." It is an expression that is more insulting than pointed. We venture the opinion that the scabbiest kind of scab is the man who is a turn-coat and a renegade to his written obligations. One of the signatories to the existing two years' agreement between the Coal Company and its workmen is Daniel MacDougall the Local President of the U. M. W. A. in Cape Breton. People who go back on their written obligations are usually known in this country as "quitters." The two years' agreement referred to stipulated that the rates and conditions agreed to remain in force for two years, or until 31st December, 1909. Recognition of the United Mine Workers would mean a change in conditions. Mr. MacDougall, who has had a considerable experience as a quick-change artist, may be able to explain how the Coal Company could recognise the U.M.W.A. and at the same time keep good faith with the P.W.A. and its workmen generally. We cannot, and we never yet met anyone who could.

One interesting result of the past two weeks' events has been to prove how thoroughly unreliable the statements of the U.M.W.A. leaders are, and have been. For a long time past the local newspapers have given a wide license to the U.M.W.A. and have published their claims in good faith. During the two weeks that have just gone, however, even the most indulgent newspaper men have had to confess that they were unable to place

any reliance on the statements given to them by the U.M.W.A. For example, Mr. Harry Bousfield, a gentleman whose accomplishments in the gentle art of stuffing newspaper men are not excelled by any of his colleagues, stated that the Coal Company could not possibly have produced more than 1,600 tons of coal on a certain day, unless they had transported it by aviation. As a matter of fact the Coal Company's output on that day was over 6,000 tons. No. 1 Colliery has so far been operated on a quite normal basis since the strike. The workmen there are P.W.A. men almost entirely, and the strike does not exist at No. 1 Colliery. Nevertheless the U.M.W.A. declared to all and sundry that the number of workmen employed there was not over 145 men. However that may be the mine that produced over 1800 tons of coal as a daily output, which would mean that so small a force as mentioned by the U.M.W. would have to "hustle some." To be exact, No. 1 had over 600 men. After a little more of this it was felt that in whatever else the U.M.W. was lacking, its capacity for prevarication was unstinted.

The result of the strike has never been in doubt. At the time of writing men are returning to work in greater numbers every day, and new men are coming in from the outside. One interesting feature has been that many of the younger men whose homes are in the country districts of Cape Breton, and who went home when the strike was called, speedily came back. In many instances the "old man" failed to understand why his son should have quit a lucrative employment at the beck of American agitators, and in more than one instance these young men have come back to work with a flea in the ear. Exactly two weeks after the commencement of the strike the Coal Company put on cars the not inconsiderable tonnage of 9,000 tons, to which total Dominion No. 1 contributed over 2,000 tons and Reserve over 1,100 tons. As we have previously had occasion to remark, the older mines, where the population is even yet largely composed of native born Canadians, have shown very little falling off in output, and the disaffection is chiefly confined to the newer mines such as No. 2 and No. 6, where the workmen are of all nationalities.

The pinch of need has not yet been felt, as the pay which was disbursed on the 17th was one of the largest in the Company's history. There are many poor wives and children, however, in homes across the water who will feel the pangs of hunger, for their husbands have been grossly ill-treated and deceived by the American leaders. These men have been prevented from working by the direct threats, the true significance of which their imperfect understanding of English does not enable them to perceive, and dread prevents them from giving the information which would enable the law to deal with these cowardly blackguards. These men have been told that if they work they will be remembered hereafter. They are told that things may be all right so long as the militia is here, "but you wait till afterwards." Many of them are going in mortal fear of their lives, and their plight is a pious one. Never at any rate in Nova Scotia has such shameful and wholesale intimidation been resorted to. The U.M.W.A. have imported interpreters from the mining districts of the States, who for months past have been instilling into the minds of these unlettered foreigners the awful consequences of thwarting the will of the U.M.W.A.

We ventured to forecast some two years ago that the coming of the U.M.W.A. into Nova Scotia meant "the bomb and the gatling, illegal trial and anarchy, and other choice flowers of American unionism." This forecast has been fulfilled to the letter, and, despite the attempts of certain interested parties to minimize the disorders which took place here, it was only the wise action of the authorities in sending us the militia, and the manner in which the troops have since been handled, that has saved us from scenes approaching civil war. The greatest honour is due to the loyal men of the Company, the railway men, the pier men, and in fact all the better element of the Company's personnel for the manner in which they have stood at

their posts. These men will see this thing through, and they deserve the thanks of the nation.

**Sydney.**—The backbone of the Glace Bay strike is broken. The Dominion Coal Co.'s shipments are steadily approaching the normal.

**Halifax.**—A large stamp mill, situated at Caribou, Halifax County, was burned to the ground early in July.

### QUEBEC.

In the case of the Eagle Mining Co. vs. Klipstein et al., judgment was given last week for the plaintiff. Cate, White & Wells, attorneys for plaintiff.

This was a case where defendants, having bought a mining property, making one payment down, defaulted on the deferred payments, and for no visible cause, having made no practical effort to mine (although that is immaterial). Plaintiff claimed that, so long as defendant was solvent, payments must be made as agreed, the defendant having no option to return the property; that the clause in such deeds which so many wrongly so interpret, is solely for the benefit of the vendor in case the buyer is insolvent, when the property reverts to vendor without action. Judgment with costs sustains this.

C. A. French and Dr. Mooney have engaged R. D. Morrison to superintend the erection of buildings for the Marsboro Gold Mining Co. The Mill property has been bought, and stamping machinery is being put in.

The St. Onge Syndicate has bought from N. S. Parker and D. T. P. Shaw an asbestos property near Mansonville, Que., for \$50,000.

Professors Dresser and Bell, of Montreal, inspected the Norton Copper Mine at Suffield, June 21.

A narrow vein of quartz carrying molybdenite was recently found in Southeastern Quebec, between granite walls; not of commercial value, but of interest as an ore rare in the province.

The Golconda Gold Mining Co. has its boarding-house nearly completed, and work on the property is proceeding favorably. It is probable that the order for machinery will be placed in Sherbrooke.

Mr. J. F. Mackenzie, of Montreal, accompanied by Mr. Wm. Marshall, of Toronto, spent a day on the property of the Compton Gold Dredging Co., in which Mr. Marshall has become interested. The financing of the enterprise is now proceeding favorably, and it is probable that a dredge will be installed this season. Mr. Mackenzie will go to New York next week in this connection. Mr. Marshall left Wednesday afternoon to look over some mining property in Nova Scotia.

### ONTARIO.

**Cobalt.**—A great deal of interest is being displayed in South Lorraine this summer, and throughout the whole of the district there is an air of activity that speaks well for the future of that section. On practically every property within a radius of two miles of Loon Lake work is being done, and as a consequence many discoveries, principally cobalt, have been made. Cobalt appears to be the principal mineral of the district, but in practically every case values in silver can be obtained on the surface. The general direction of the veins is northeast and southwest. The diabase is the best producing formation, but many important discoveries have also been made in the Keewatin, particularly when near a contact. Unlike the Cobalt camp, work up to date in the Huronian conglomerate has shown that formation to contain little of value. During the summer there will be a large increase in the amount of development being done, and if the same success is attained as has followed the work up to date, the district of South Lorraine promises to be one of the best outside of Cobalt. On the Great Northern claim only about 25 per cent. of the surface has been prospected,

and ten veins have been found. Two of these are aplite, with an average width of about three inches, while the rest are calcite, some of them carrying nickel and cobalt. Considerable diamond drilling is also being done. There is one shaft on the property, which is down a distance of fifty feet, and a 3-inch vein is showing in the bottom.

The south half of the Haileybury Silver H. R. 16 claim recently purchased by New York and Buffalo people is now known as the Magna Canadian. At the 70-foot level of the shaft a drift is being driven to the south on a 5-inch vein of calcite carrying small values in silver.

The new plant at the Keeley mine started running about the first of July, and it is working very satisfactorily. It is a suction gas producer of 220 horsepower capacity, and supplies power for the whole plant. The main shaft is now down to a depth of 130 feet, and at that point a station is being cut. On the west side of the property the new No. 3 shaft is down 50 feet on a large vein of cobalt. A force of 30 men is employed.

At the Wettlauffer, the new machinery is also running, and as a consequence development work is being done on a more extensive scale. The shaft is now down over 85 feet, and at the 60-foot level a station has been cut and a drift started on the vein discovered last fall on the surface. Another vein has been cut 30 feet to the south by a cross-cut from the station. In the bottom of the shaft the vein shows 6 inches of high-grade ore. At present there are 40 men employed on the property, but this force will be largely augmented in the near future. New camp buildings to accommodate 100 men are being erected.

The Harris-Lorrain syndicate, whose holdings consist of 20 claims, are getting ready to do a large amount of work. On the property G. F. 12 camps are being put in shape so that development work can be started on six claims in the northern section. On claim H. R. 88 a small 20 horsepower plant has been installed. In order to continue sinking, air will probably be obtained from one of the neighboring mines. The shaft is now down over 30 feet on a calcite and cobalt vein. This company are also developing their properties to the west of Ox Bow Lake, and on one of the claims there a shaft is being sunk.

The shaft on the Currie property is down 100 feet, and from the bottom a drift has been started on the vein. The vein was traced for some distance on the surface, where it had a width of from 2 to 5 inches.

At the Beaver Lake mine the shaft is down 90 feet, and drifts have been run north and south on the vein. There is 25 inches of vein matter, consisting of calcite and cobalt with some silver value.

Since the alteration in the mining laws of the Province of Quebec there has been a great increase in the interest manifested by prospectors, and it is quite apparent, from the number going in, that the country will be well explored. During the month of June fifty prospecting parties passed through Ville Marie. Mr. E. Boisseau, who has a property on Lot 5 of the south range of Favre Township, is putting in a small plant. A shaft will be sunk on a 5-inch vein of cobalt, said to contain good silver values.

The four diamond drills and one churn drill working on the big nickel deposit at mileage 222 of the T. & N. O. Railway, for the International Nickel Company, have been taken off. It is understood that the results attained were very satisfactory.

The diamond drilling has been stopped at the Alexandria Mine. Two calcite veins carrying good silver values were cut by the drill. The shaft will be sunk from the 125 to the 200 foot level, and from the lower level a cross-cut will be started to catch the new leads.

On the property of the Cobalt Leasers at Peterson Lake the diamond drill working there went through the diabase into underlying conglomerate.

The Hydraulic Company at Ragged Chutes have one of the intake shafts completed, and on the other one there is still 100

feet of work to be done. The outlet shaft is completed, and in the tunnel there is about 400 feet of work remaining before the two headings will connect. About five and one-half miles of the main pipe has been welded, and when it is finished four separate gangs will start the loop of 12-inch pipe which will encircle the district.

The big fire which wiped out the northern part of the town, has given the La Rose, Chambers-Ferland and Nipissing Companies, who own the land, the long-desired opportunity to prospect this territory. The Nipissing has had over 100 men at work trenching, and the work is almost completed. Proper surveys are being made of this section, and the ground will be laid out into building lots, with wider streets. Much-needed building restrictions will also be enforced.

The Nova Scotia has been having an unusual run of luck lately, several veins having been found within a week. The first important discovery, known as the Bilsky vein, was found near the manager's house, and it is one of the finest surface discoveries in the camp. While stripping this vein, two other cross-veins were located. At the junction of one, the more important of these, with the main vein, a shaft has been started. Subsequently two other discoveries were made, one distant about 75 feet and the other 190 feet from the Bilsky vein. All of these are high-grade ore. An interesting feature of the discovery of the Bilskey vein is the fact that it was crossed by a trench dug several years ago. At that time the prospectors had no knowledge of it.

The Nipissing Central Railroad Company, who are building the electric line between the towns of Cobalt, Haileybury and New Liskeard have had a large number of men working on the right of way, and a few days ago 100 more were started. The company expects to have the line completed to North Cobalt by the first of October. The section between Haileybury and New Liskeard will probably not be built this year. There is considerable difficulty experienced by the company in settling the matter of the right of way. The line has to run over the property of some of the mining companies, and so far no agreement has been reached by the different parties interested as to what the rental should be for using the land of the mining companies. It is altogether likely that the courts will have to be appealed to, to appoint an arbitrator, who will settle the question.

From one of the shafts on the Farah property a cross-cut is being driven at the 100-foot level to tap the "Blacksmith" vein, that in the open cut showed good silver values.

During the next week the Silver Cliff mine will ship a car each of high-grade and second-grade ore. The mine will now be put upon a regular shipping basis.

Recent development on the 195-foot level of the Cobalt Lake mine has proved the vein found to the west of No. 6 shaft to be a little better than three inches in width of high-grade ore.

At the meeting of the directors of the Nova Scotia held at the mine on July 15, it was decided to commence at once the erection of the new mill. Mr. Kirby, who designed the mill and worked out the process, will remain to take charge of the construction. The cost is estimated at \$100,000, and the building will be located close to No. 3 shaft house. The building itself will be 222 feet long and 84 feet wide. The building of this mill will be followed with keen interest by the operators of the camp, as it will be a very wide departure from the concentrators that have already been erected. The process will consist of crushing, amalgamation and cyaniding. A mill test of the ore has been made in Nevada. No concentrating tables will be used in the mill, although provision will be made for their installation if they are found necessary. The capacity of the mill is estimated at 90 tons per day. The product from the plates and the zinc boxes will be shipped from the mine in the form of bullion. Twenty 1,650-pound stamps will be installed.

The meetings held between the representatives of the Nipissing Central Railway and the mining companies regarding the right of way for the new electric road, have so far been

without results. The difficulty rises out of the rental asked by the companies, and it is altogether likely that the courts will be appealed to, to appoint an arbitrator.

The Maple Leaf Syndicate, Limited, is a new company recently organized in England for the purpose of taking over fourteen claims in the townships of Brewster and Corkhill. The head office of the new company is at Walbrook, London, E. C., and the promoters have raised the sum of \$50,000 to carry on the development work.

The contract for building the wagon road from Elk Lake to Gowganda has been let to the firm of Blair & McClelland, of New Liskeard. A good deal of difficulty was encountered by the department in placing this contract, as three contractors refused to do the work. As a consequence their deposits, amounting to \$2,600, were forfeited.

In the course of stoping on the main vein of the City of Cobalt, a shoot of high-grade ore about five inches in width was encountered. The Company proposes to carry on the exploration work on the surface by means of a diamond drill.

A rich surface find has been made in the north-west corner of the Hargraves property. The ore body is about six inches in width.

Work will very shortly be resumed on the property of the Townsite Mining Company. The capital necessary to carry on the work has been raised in England.

A new vein has been found on the 112 ft. level of the Kerr Lake Majestic at a point about 85 feet to the north of the shaft. The vein matter consists of cobalt with small silver values. It is understood that the Lewisoshns of New York have acquired control of the Kerr Lake Majestic, which adjoins the Kerr Lake, a property also controlled by them. They have also recently purchased the Michael claim, located on the east side of Cross Lake. So far but little work has been done on the latter property as it has been in litigation for about three years.

It is understood that La Rose has made arrangements to sell their big dump on the property adjoining the Right of Way.

While excavating for the new addition to the concentrator of the Coniagas a new vein was discovered. This company is running a trench up Prospect Avenue, one of the main streets of the town, in order to try to locate a vein reported to be in that section.

The petition, asking for an injunction to compel the directors of the Crown Reserve to stop the payment of dividends until the 231 shares now in dispute receive dividends along with the rest of the shares, has been dismissed. The statement for the six months ending June 30th shows a surplus of \$549,259. During that period there was a total of 1878 feet of development work done, and over \$40,000 was expended in new buildings and equipment.

The second asking for tenders for the mining lands of the Gilles Limit resulted in the sale of twelve lots aggregating 19 acres. As 283 acres were sold before, this leaves 392 acres still remaining in the hands of the Department. It is understood that another sale will take place later on.

#### BRITISH COLUMBIA.

**Rossland.**—As the directors of the Le Roi Mining Co. are in convention at London it is expected that word will be sent here to begin work at the Le Roi Mine any day now.

The Blue Bird Mining Co., through the managing director Mr. Lyman Carter, has acquired the lease which Whitford and Jenkins had on the mine. It is the intention of the Company to work the property itself, and a thorough plan of development will be worked out if some preliminary work that is being done turns out well. It is the intention to sink a double compartment shaft and open up the property at depth. At this writing, there is a quantity of ore at the mine awaiting shipment. Carbonate ore has been opened up on the Blue Bird that with a little sorting has returned about \$80 per ton. As there are several veins

on the surface of the Blue Bird, some of which appear to be offshoots of the main vein, it is expected that ore will be found in greater quantity as depth is attained.

Among the steady shippers to the Trail smelter, aside from the Centre Star group and Le Roi Two at Rossland, are the following mines: Snowshoe, St. Eugene, Silver Cup, Silver King, Granite, Yankee Girl, Richmond-Eureka, North Star, etc., etc.

The shaft on the Hattie Brown is now down over 75 feet, the vein showing up about six feet wide at this point. Recent assays give returns of \$49 per ton.

A meeting of the board of directors of the B. C. Mining & Development Co. was held during the past week. Dr. G. A. Ulerick was present from Chicago. The doctor is here for the purpose of discussing ways and means for the starting of work on the company's copper claims on St. Mary's river. A prominent engineer has made a report on the property and the outlook is favorable.

Le Roi 2, Ltd., continues to work along with the usual good results. During May, the confirmed report shows, 2168 tons of first class ore was sent to Trail smelter, from which the smelter receipts were \$48,349, or something over \$22 per ton, which is close to the yearly average. Eighty-two tons of concentrate returned \$41.44 per ton. According to average figures for this mine, the profits were approximately \$24,000; a good profit on the tonnage shipped, for this camp particularly. The yearly report of the Le Roi Two shows up very well as it has no big steam-air compressing plant to write depreciation off as one or two of the other local companies have. This concern produces air for drilling and clearing the mine from a neighboring plant and does its hoisting, etc., by electricity from the Bonnington Falls plant.

**Nelson.**—After nearly seven years of litigation the famous apex case of Star Mining & Milling Co. vs. Bryon N. White & Co. has come to an end in the Privy Council. The appeal of the White Company was refused, which leaves the decision as it left the Supreme Court of Canada, in favor of the plaintiff. The White Co. mined considerable ore from a vein which dipped into Star ground, but which to all appearances apexed on the claims owned by the first-named company. The vein, if it was one vein, was faulted at depth, being found again after some work through barren ground. The point of contention in the recent case was whether or not the ore in the ledge on the Star ground apexed on the property of the B. N. White Co., and from the decision of the Court it would appear the latter conclusion is arrived at from the evidence submitted.

An ore body of value was opened up at the St. Eugene last week. This property continues to look well underground. Shipments to the Trail smelter run from 550 to 700 tons per week; while the mill and concentrator is running steadily.

A new tunnel is to be started on the Aurora property across Ioyie Lake from the St. Eugene. There is a quantity of ore in the ground ready for shipment.

The Gold Note, a property near the Granite, shipped out four tons of high grade ore recently. It is planned to work the property all season.

Mining is particularly lively in the Salmo section this year. There are quite a number of prospectors in the hills, and active work is being done on many of the small mines. The Arlington is sending out a steady tonnage of \$65 ore, and there are 45 men working at the Second Relief where the mill is treating nearly 50 tons per week.

**Phoenix.**—A change has been made in the directorate of the C. Copper Co., which, it is anticipated, will mean even greater progress for this company in the future than has been the case in the past. Mr. Adolph Lewisohn, of New York, taking

advantage of the comparatively low price at which the stock of this company could be bought while the market was so quiet, has acquired a big interest in the concern, and has been made a director. The present outlook for the Copper Company is good. It has been possible to land copper in New York at 8c per lb. this year, and the company's mines at Deadwood, Wellington, Central, etc., have big quantities of ore in them ready for stopping, and will soon have much-needed railway facilities; that is, the latter two camps. Now that the Alberta coal strike has been settled, it is likely that the International Coal & Coke Company will soon commence to ship fuel to the Copper Company at Greenwood. It is a difficult matter to say, however, just when operations will be resumed, as the Greenwood Miners' Union has declared a strike against the B. C. Copper Company for alleged non-recognition of that body and discrimination against its members. No doubt the Copper Company would have resumed work as soon as there was sufficient fuel on hand, had it not been for this last affair. As it is, if some amicable arrangement is not made, there may be more or less difficulty in getting a full quota of first-class miners.

Another one of the promising mines in Franklin camp has been bonded. This time it is the McKinley group, which has been taken over by G. A. McLeod and associates, of Spokane, Wash. With the completion of the railway to Franklin camp the McKinley, Maple Leaf and other mines of that district will come rapidly to the shipping list.

A body of excellent copper ore has been opened up on the claims of the Columbia Copper Mining Co., Friday Creek. Some of the ore carries as high as 15 per cent. copper, with some gold. The ore has been pierced for 34 feet on one side of Friday Creek and a tunnel driven 71 feet on the opposite side.

The Greenwood-Phoenix tunnel has been driven 170 feet to date, the drilling being done by hand work. It is expected, however, that the compressor now in place at the mouth of the adit will be furnishing power in a few days.

A. B. Clabon, managing director of the Kingston Gold-Copper Mining Co., visited the property at Hedley last week. It is very likely that a compressor and power drills will be installed at the property in the near future, as development has reached a stage that would seem to warrant such action.

Among the names of newly registered companies in this province appears the title of the New Dominion Copper Co., capitalized at \$1,000,000 in shares of \$5 each. This is a smaller capitalization than was at first proposed by the reorganization committee, i.e., \$1,250,000. It is hoped that the mines of the New Dominion Company will be working by August 1st. A new Greenwood concern that is driving a parallel tunnel to the Phoenix-Greenwood tunnel into the high-grade hill at Greenwood is the Argo Mining & Tunnel Co., with a capitalization of \$125,000 in 25c shares.

The tunnel on the E. P. U. claim near Greenwood is now in the hill over 1,300 feet. It is expected by the operators, a Greenwood syndicate of mining men, that the ledge will be encountered any day now.

The plant at the Jewel mine, Long Lake, is to be augmented. It is thought that the new concentrating process the company has adopted will prove a success on Jewel ore. There are large quantities of concentrating ore in the mine.

**Vancouver.**—Placer gold has been found in the sands of Seymour Creek near here. Ground has been located on the creek by an old Australian prospector and others, and from 10c to 20c per pan is being obtained.

Samples running from \$26 to \$258 in gold have been taken from a ledge near Lillooet Lake that is nearly 300 feet wide. An Indian made the find. Several locations have been made, and further work will be done and average assays taken.

## GENERAL MINING NEWS.

## ONTARIO.

**Sulphide.**—Pyrite mining is becoming increasingly active. Two new concerns are now operating.

**Madoc.**—The Geo. H. Gillespie Talc Company is soon to double its grinding plant. Its product is now being shipped to Europe in addition to supplying the Canadian market.

**Cobalt.**—The Buffalo Mines, Limited, has placed at the disposal of the Cobalt civic authorities the tank and pumping apparatus installed at the Buffalo mine. This generous offer is much appreciated.

The Coniagas plant is soon to have 30 stamps added. This will make a total of 60 stamps.

**Sturgeon Lake.**—Numerous reports of gold finds are heard. Authentic news is lacking. The Provincial Government is to send Mr. E. S. Moore to the district before the summer is over.

## BRITISH COLUMBIA.

**Rossland.**—A considerable body of low grade ore has been found on the sixteenth level of the Centre Star mine, shipping

ore, 14 feet wide, has been encountered on the sixth level. The big ore shoot on the ninth level of the War Eagle has been opened up west from the crosscut.

**Trail.**—On Friday, July 9th, the smelter of the Consolidated smelted 250 tons of lead ore and produced 130 tons of bullion in 24 hours. This beats all previous Canadian records.

**Nelson, July 10.**—the amalgamation of the British Columbia Copper Company and the Dominion Copper Company, with the mines and the smelters at Greenwood, is definitely announced from the East.

The strike situation on the properties of the first named company remains unchanged.

The holidays interfered with the week's output, and the shipments appended in detail are below the average.

## YUKON

**Dawson.**—The first stamp mill erected in the vicinity of Dawson is soon to be in operation. It is a two-stamp mill, and is to be placed on the Lone Star property.

## MINING NEWS OF THE WORLD.

## GREAT BRITAIN

The eleventh hour agreement between the South Wales operators and miners, ratified by the Miners' Federation of Great Britain, was announced on July 1st.

After two hours' deliberation the following report was supplied to the press:—"The deputation appointed from the Federation to assist the South Wales workmen's representatives in their negotiations with the owners tendered a report of the joint meeting held at Cardiff yesterday, at which the following terms were adopted:—"The workmen's representatives having declared that it is not their intention to prevent the mutual introduction of any new method which may lead to the better working of the pits, due regard being had for safety and economical working, it was agreed that the owners shall have freedom to propose any method of working their collieries without being met with the objection that their doing so is a breach of custom of the Conciliation Board agreement, and the workmen allege that the proposed method of working is a source of extra danger to the workmen employed at the colliery. This question, in the event of a failure to agree at the colliery, shall be referred to the decision of an experienced and disinterested person to be agreed upon by the owners and workmen's representatives on the Conciliation Board, or failing such agreement, to an experienced and disinterested person to be appointed by the Home Secretary—the owners and workmen to be at liberty to call evidence before the person agreed upon or to be appointed. Any further objection to be brought before the Conciliation Board in the usual way, and the Board shall either decide the matter or report failure to decide within two months from the date of reference."

The conference decided, having heard the report of the deputation and the terms of the agreement, to adopt the same as satisfactory, and thanked the representatives for their services in the matter.

A discussion afterwards took place upon an application received by the miners in Scotland for a 12 1-2 per cent. reduction in their wages, a joint meeting to consider which is to be held in Glasgow on Wednesday next. After discussion the following resolution was unanimously adopted:—

"That this conference hears with deep regret that the Scotch coal owners are pressing for a reduction of 12 1-2 per cent, in the

workmen's wages in Scotland. And we hereby adhere to our previous decision to resist any such reduction. In the event of the employers pressing their claim we empower the officials hereby to call a special conference with a view to deciding whether rule 20 shall be put in force to resist any such reduction."

Rule 20, it may be explained, empowers the Federation to take a ballot of the whole of the miners in the United Kingdom as to whether the men shall hand in their notices and support the affected miners by causing a national stoppage.

## RUSSIA

The estimated gross production of crude oil by the Baker Russian Petroleum Company for the week ended June 26th, was 2,569 tons.

## SOUTH AFRICA

Mr. R.S. Holland, the British Board of Trade Commissioner, has completed his investigations of the Witwatersrand mining industry. Mr. Holland, in an interview, pointed out that German manufacturers had their representatives in the field, and that British manufacturers would have to follow suit. The opportunity of large business in mining machinery was exceedingly good.

The half-year's dividend distribution of Rand mining concerns amounts to £4,542,494. Including mines in outlying districts the total amount is £4,592,695. These dividend payments

represent 6s. 1½d. of every sovereign won. In the course of a speech at the Goerz annual meeting, recently held at Johannesburg, Mr Francke mentioned that the charge for blasting gelatine—the form of explosive most used by the mines—which in 1908 was 52s 6d per case, has been reduced to 45s per case practically all round; and as regards water legislation was contemplated with a view to enabling the Rand Water Board to cut down its rate of 3s per 1,000 gallons to a price in the neighbourhood of 1s. 3d. It is quite clear that such a reduction by the Rand Water Board will serve as a standard for the price of water for mining operations from other sources as well. Another matter affecting the unskilled labour question has been taken in hand—namely, the selections of a stope drill

light weight. Drilling in stopes has so far to a great extent been carried out by the manual labour of the natives, but if a suitable drill can be manufactured this work can be done by mechanical force and a large number of natives set free for other work. The trials now proceeding by the Chamber of Mines in conjunction with the Government are not yet concluded, but it can already be stated that the prospects of obtaining a practical and useful stope drill are favourable.

### UNITED STATES

An appeal is to be taken in the action of Bliss vs the Washoe Company (the smoke case.) An injunction to close the Anaconda smelter was refused the farmers of Deer Lodge valley. The appeal is against this refusal.

The Butte mining companies are experimenting with electric power as a substitute for steam in transportation. The change is expected to reduce costs by one-third of a cent per pound of copper.

### MEXICO

The announcement from the oil fields of Mexico of the large new company for developing the oilfields has attracted considerable interest. It concerns the future position and work of Messrs. Pearson and Son (Oilfields Department), and, if correct, exceeds in importance all news which has recently come to hand from this great centre or petroleum excitement and activity. The concessions cover the holdings of the Pearson Oilfield Department north and west of an imaginary line drawn at about 19 degrees long west from Washington, and extending from Vera Cruz (in an almost direct line south) to Puerto Angel, on the Pacific Ocean, in the State of Oaxaca. They include the Dos Bocas field, the scene of the famous burning oil fountain, and certain rights Messrs. Pearson & Son have acquired by contract from the Oilfields of Mexico Company. The Compania Mexicana de Petroleo El Aguila, Mexican in charter, operations

and character, will confine their interests to developing, exploiting and marketing home products in Mexico; they will not only produce and market the product of the fields north and west of the imaginary line drawn from Vera Cruz to Puerto Angel, but they will also market in Mexico the products of the fields south and east of the line and in the States of Vera Cruz and of Oaxaca, on the Isthmus of Tehuantepec, and the States of Tabasco, Chiapas, Campeche and Yucatan.

The old company of Messrs. Pearson & Son (Oil Fields Department) will produce, refine and export only, and will go out of the Mexican market, both wholesale and retail. Messrs. Pearson & Son are interested in the Compania Mexicana de Petroleo El Aguila as shareholders. For the present, however, the most productive fields owned by Messrs. Pearsons, lying south of the imaginary line, continue in the possession of that firm, leaving them with the refinery at Minatitlan and a large number of producing wells on the isthmus. Later accounts state that, while the capital of the new company is £5,000,000, not £3,000,000 as at first announced, it is a fact that all the shareholders are multimillionaires and control unlimited finance. One of the directors is Colonel Diaz, Jr., son of President Diaz. The company's lands are 3,000,000 acres in extent, and great refinery and pipe line extension schemes and new property acquisitions are being talked about.

Considerable conjecture is being indulged in with respect to the latest Mexican oil company and the concession recently granted to the Oil Fields of Mexico Company, and, although it is denied that any deal is pending between the two, business men anticipate that before long the Furber holdings will be acquired by the Compania Mexicana de Petroleo El Aguila. Nothing that is happening in petroleum centres on the other side of the Atlantic approaches in importance the conduct of Messrs. Pearsons in the oil fields of Mexico. Their investments are known to be considerable, certainly between £2,000,000 and £3,000,000, and they are still at war with Standard Oil interests.

### COBALT ORE SHIPMENTS—WEEK ENDING JULY 17.

There was a falling off last week both in the number of mines that shipped ore and in the weight of the output. Compared with eleven shippers of the past three weeks there were only eight, and the tonnage amounted to 443,21, or 30.49 tons less than a week ago. The total number of pounds shipped during the week was 886,420. Nipissing again headed the list with 2,110 pounds, and Crown Reserve and La Rose came next with

shipments close up to the two hundred thousand mark. All the others failed to ship over 65,000 pounds.

| B. C. Copper, Greenwood . . . . . | .....  | 140,505 |
| Total . . . . .                   | 23,118 | 859,993 |

Following are the figures of German consumption of foreign copper for the months January-May, 1909:—

|                             |             |
|-----------------------------|-------------|
| Imports of copper . . . . . | 65,956 tons |
| Exports of copper . . . . . | 2,648 "     |

Consumption of copper . . . . . 63,308 "  
as compared with consumption during the same period in 1908 of 68,893 tons.

Of the above quantity 60,353 tons were imported from the United States.—Reported by L. Vogelstein & Co., N. Y.

### TORONTO MARKETS.

#### Metals.

July 23.—(Quotations from Canada Metal Co., Toronto.)

Spelter, 5¼ to 5½ cents per lb.

Lead, 3.4 to 3.5 cents per lb.

Antimony, 8 to 9 cents per lb.

Tin, 30½ cents per lb.

#### Copper—

Casting, 13.5 per lb.

Electrolytic, 13.75 cents per lb.

Ingot Brass—10 to 14 cents per lb.

Pig Iron—July 23.—(Quotations from Drummond, McCall & Co.):

Summerlee, No. 1, \$23 (f.o.b. Toronto).

Summerlee, No. 2, \$21.75 (f.o.b. Toronto).

Midland, No. 1, \$19.50 (f.o.b., Toronto).

#### Coal—

Anthracite, \$5.50 to \$6.75.

Bituminous, \$3.50 to \$4.50 for 1¼ inch lump.

### MARKET REPORTS.

#### Coke.

July 30.—Connellsville coke, f.o.b. ovens—

Furnace coke, prompt, \$1.50—\$1.60 per ton.

Foundry coke, prompt, \$1.80—\$1.90 per ton.

#### Metals.

July 20.—Tin, straits, 29.125 cents.

Copper, prime lake, 13.375 cents.

Electrolytic copper, 12.80 to 12.90 cents.

Copper wire, 15 cents.

Lead, 4.30 to 4.35 cents.

Spelter, 5.425 cents.

Sheet zinc, 7.50 cents.

Antimony, Cookson's, 8.25 to 8.375 cents.

Aluminium, 21 to 24 cents.

Nickel, 40 to 47 cents.

Platinum, 22.50 to 23.50 per oz.

Bismuth, 1.75 per lb.

Quicksilver, \$43 to \$44 per 75 lb. flask.

### Silver Prices.

# NEW BOOKS on MINING, METALLURGY POWER GENERATION

## Principles of Mining

Valuation—Organization—Administration

Copper, Gold, Lead, Silver, Tin and Zinc

By Herbert C. Hoover, E. M.

200 pages, 6 x 9, illustrated, \$2.50 (10/6) net postpaid

Published April 1909

## A Manual of Underground Surveying

Loyal Wingate Trumbull, E. M.

Consulting Mining Engineer; formerly Professor of Mining, University of Wyoming; formerly United States Deputy Mineral Surveyor for Colorado

Over 250 pages, 6 x 9, fully illustrated, \$3.00 (12/6) net postpaid

## Mining Methods in Europe

By Lucius W. Mayer

Mining Engineer

170 pages, with many illustrations, \$2.50 (10/6) net, postpaid

This book places the latest information at the disposal of mining engineers and mining men. It is a most valuable piece of work and of the greatest importance to the mining man who seeks more economical and practical methods.

The illustrations from photographs taken in the mines by the author are a striking feature.

## The Study of Ore Deposits for the Practical Miner

With descriptions of Ore Minerals, Rock Minerals and Rocks.

A Guide to the Prospector.

By J. P. Wallace, M.D., E.M.

Member of the American Institute of Mining Engineers, and the Colorado Scientific Society

Over 350 pages, 6 x 9, with over 100 illustrations, cloth \$3.00 (12-6) net

Leather edition, pocket size, thin paper, \$3.50 (15s) net

## McNeill's Code

(1908 Edition)

\$13.00 net postpaid

This new edition does not contain a single code word appearing in the former edition. It is brand new, with a great many additions and is the best general code offered.

It covers the mining field with the greatest thoroughness and meets all requirements of all business. It is three times as large as the old edition.

The terminal index is embodied in this code.

## Notes on Metallurgical Mill Construction

Edited by Walter Renton Ingalls

256 pages, 6 x 9, cloth, \$2.00 (8/6) net postpaid

A New, One-Volume Edition of

## The Nature of Ore Deposits

By Dr. Richard Beck

Professor of Geology, Mining Academy, Freiberg

Translated and revised by Walter Harvey Weed

Formerly published in two volumes. Now issued in one volume.

\$6.00 (1£5s) net postpaid

## Millwrighting

By James F. Hobart, M. E.

400 pages, 6 x 9, fully illustrated, \$3.00 (12/6) net postpaid

(Published March 1909)

## Notes on Lead and Copper Smelting

Revised to November, 1908

By Hiram W. Hixon

162 pages, 6 x 9, \$3.00 postpaid

## Copper Mines of the World

By Walter Harvey Weed

Price \$4.00

## Principles of Copper Smelting

By Edward Dyer Peters

Price \$5.00

## The Metallurgy of Steel

By Bradley Stoughton

Price \$3.00

## The Manufacture and Properties of Iron and Steel

By Harry Huse Campbell

Price \$5.00

## A Manual of Fire Assaying

By Chas. H. Fulton

Price \$2.00

## Hydrometallurgy of Silver

By Ottokar Hoffman

Price \$4.00

## The Electric Furnace

By Alfred Stansfield

Price \$2.00

## Mining, Mineral and Geological Law

By Chas. H. Shamel

Price \$5.00

## Mine Timbering

By Sanders, Parlee, Macdonald and others

Price \$2.00

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

# Geological Survey

## **PUBLICATIONS**

The Geological Survey has published maps and reports dealing with a large part of Canada and with many local areas and special subjects

### **MARITIME PROVINCES**

The whole of Cape Breton and a large portion of the coal and gold fields of Nova Scotia have been reported upon and mapped on a scale of 1 mile to 1 inch. The remaining portions of the province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter provinces, mapped on a scale of 4 miles to 1 inch.

### **QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the province north of the St. Lawrence are also available.

### **ONTARIO**

A large part of the province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

### **THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the provinces of Manitoba, Saskatchewan and Alberta.

### **BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the province, have been reported upon and mapped.

### **YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

### **THE NORTH-WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

*Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

### **THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED :**

#### **NOVA SCOTIA**

- 1019 City of Halifax Sheet.  
1025. Waverley Sheet.

The above two sheets belong to the regular series of Nova Scotia map sheets on a scale of one mile to one inch. The first includes Halifax City and Harbour, the second the Waverley Gold District.

#### **ONTARIO**

1076. Gowganda Mining Division.  
This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

#### **BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.  
This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shews the geology and location of veins.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch, by W. H. Boyd.

NOTE.—Maps recently published may be had on linen cloth for use in the field at the price of 10c. per copy.

#### **REPORTS**

1072. Summary Report of the Operations of the Geological Survey for year 1908.

The Geological Survey, under certain limitations, will give information and advice upon subjects relating to general and economic geology. Mineral specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

*Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

*When answering Advertisements please mention THE CANADIAN MINING JOURNAL.*

## University of Toronto

FACULTY OF APPLIED SCIENCE  
AND ENGINEERING

## Courses in

1. Civil Engineering.
2. Mining Engineering.
3. Mechanical and Electrical Engineering.
4. Architecture.
5. Analytical and Applied Chemistry.
6. Chemical Engineering.

Diploma granted at the end of three year  
B. A. Sc. at the end of one additional year.

## Professional Degrees:

Civil Engineer (C. E.)  
Mining Engineer (M. E.)  
Mechanical Engineer (M. E.)  
Electrical Engineer (E. E.)  
Chemical Engineer (C.E.)

For Calendar and other information apply to the  
Secretary

A. T. LAING.

## School of Mining

A COLLEGE OF APPLIED SCIENCE

AFFILIATED TO QUEEN'S UNIVERSITY

KINGSTON - ONTARIO

1. Four Years' Course for a Degree (B.Sc.)
2. Three Years' Course for a Diploma in
  - (a) Mining Engineering.
  - (b) Chemistry and Mineralogy.
  - (c) Mineralogy and Geology.
  - (d) Chemical Engineering.
  - (e) Civil Engineering.
  - (f) Electrical Engineering.
  - (g) Mechanical Engineering.
  - (h) Biology and Public Health.
  - (i) Power Development.

For Calendar of the School and further information apply to The Secretary, School of Mining,  
Kingston, . . . . . Ontario

## Michigan College of Mines

F. W. McNair, President

Located in the Lake Superior district. Mines and mills accessible for College work. For Year Book and Record of Graduates apply to President or Secretary.

HOUGHTON - - MICHIGAN

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,

**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries**  
Quebec.

## Province of Nova Scotia

**Leases for Mines of Gold, Silver  
Coal, Iron, Copper, Lead, Tin**

# BRITISH COLUMBIA

# The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals or a total of **\$273,643,722.** The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,033. The Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

## HON. MINISTER OF MINES

Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.

## OFFICES

**Manning Arcade, Toronto**  
**Fernie, British Columbia**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
 Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

**CHAS. SIMISTER,**  
 General Superintendent.

**J. D. HURD,**  
 General Manager.

## Spend Your Summer at Muskoka

**GRAND  
 TRUNK  
 RAILWAY  
 SYSTEM**

Canoe in innumerable channels and waterways among green islands—fish, bathe—live on and in the water—and on shore play golf and tennis.

### Muskoka Lakes, Canada

Less than a day's journey from the principal American cities, via Niagara Falls, Detroit, Chicago. Solid trains from Buffalo and Toronto. Modern hotels set in fragrant pines afford splendid service. Hay fever is unknown.

Handsomely illustrated descriptive matter free on application to

MONCTON, N.B.

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

## Canadian Westinghouse Co., Limited

# HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

# Sullivan Diamond Drills

Sullivan Diamond Drill at the O'Brien Mine, Cobalt, Ont.

Mining at Cobalt, the most attractive district in Canada, is based to a large extent upon tests made with Sullivan Diamond Drills.

The cores which these drills secure from angle holes, intersect the steeply pitching veins at depth and determine beyond question the persistence of surface showings and their value.

There are now 17 of these drills in use in and about Cobalt, indicating the importance which is placed on their work.

# TIMBERING AND MINING

By W. H. STORMS

**W**E regard this as the best book on practical mining methods that has ever been offered. It has nothing to do with the theory, but is a straightforward account of the best methods employed under various conditions at the leading American mines.

It deals with the kind of timber to be used, timber preservation, structural steel, and all other phases of timbering.

It deals as well with shaft sinking, bucket dumping, head frames, etc., etc.

It is a complete book of practical value, and sold subject to our absolute guarantee. 270 pages, 6x9, fully illustrated. \$2.00 net postpaid.

**GUARANTEE**—When cash accompanies an order for a book, the purchaser may, within five days of receipt of the books, return any or all of his purchase, for any reason whatsoever, and his money will be refunded immediately.

### What a User says of the Deister:

I have yours of the 7th inst. and am pleased to advise you that the results obtained at our Calvario mill with the Deister No. 3 Concentrating tables under my personal observation in treating the ores from the Carboncillo mine were not only satisfactory but have made it possible for us to treat one of our low grade ores at a good profit which heretofore could not be treated except at a loss. Ours is a gold-silver ore which was given to your table through an 80-mesh screen at the rate of about 12 tons per 24 hours. The table requires but very little attention and from our experience I am convinced that there is no machine now in use which could give us the results obtained. Neg. Minera "El Carboncillo y Anexas, S. A.," Zacualpam, Mexico. Yours truly, (Signed) A. C. Chabaud, Mgr.

## Underwood

The man who buys an Underwood typewriter does not bring the price into discussion.

He does not buy the Underwood on a price basis. He knows that to pay less is to get less—a great deal less.

He knows that in buying an Underwood he will get full value for every cent of the cost. And for this reason, Underwoods in Canada outnumber all other makes of typewriters combined.

## Carbons

(Black Diamonds) for Diamond Drills

Largest carbon ever found.  $\frac{1}{4}$  actual size.

NOTE. We personally break (in this country) our carbons, thereby enabling us to determine accurately their quality. We deal only in very best quality and are always ready to ship goods on approval and for selection to responsible parties. Write us.

Most roofings are made of only *one layer*, but Amatite is made in *five layers*. The bottom layer is wool felt, the next is real Coal Tar Pitch, the third is wool felt, the fourth is pitch again, into which is embedded the fifth layer, namely the *mineral surface*.

If the weather should, in the course of years, wear away the mineral surface and dispose of the layer of Pitch which is the most

waterproof substance on earth), it would still have to penetrate a layer of felt and another layer of composition and another layer of felt before the roof would leak.

It is easy to see why Amatite lasts so long when you realize how it is made.

That mineral surface requires no painting or coating whatever, and will take the brunt of the weather without renewal or attention or care.

Send for a sample of Amatite. It's free.

# ELECTRIC HOISTS

— On Hand —

Owing to the failure of one of our customers due to the financial depression, we have on hand two Electric Hoists as follows:

1 double drum electric slope hoist having drums 60 inches diameter by 38 inches face arranged tandem. Capacity 8000 lbs. at speed of 350 feet per minute on a 35° slope, equipped with 75 H.P. type F. alternating current motor, 440 volts, mounted on same frame and having the necessary controller and resistances, dial Level indicator for each drum.

1 double drum electric hoist for vertical shaft, drums 60 inches diameter by 38 inches face arranged parallel. Capacity 4000 lbs. at speed of 450 feet per minute, skips being operated in balance equipped with 60 H.P. type F. alternating current motor 440 volts, mounted on same frame and having the necessary controller and resistances, dial Level indicator geared for 500 feet.

They are high class machines in every respect and will be sold at a low figure.

## THE INFLUENCE OF THE RAILROADS OF THE UNITED STATES AND CANADA ON THE MINERAL INDUSTRY.

To that distinguished philosopher, Dr. James Douglas, the mining world acknowledges a large debt. He is one of that small class of thinkers who can infuse life and meaning into the dry bones of statistics. A sane advocate of the conservation of natural resources, his writings are inspiring and illuminating.

In his latest essay, a part of which appears on other pages of this issue, Dr. Douglas dwells instructively upon the inter-relation of railroads and the mineral industry. Many of the facts that he adduces will be new to our readers; his conclusions are momentous.

It is surprising to learn, or to be reminded, that the first transcontinental railroad, that across the Isthmus of Panama, was built to satisfy a mining craze. This line, connecting Navy Bay on the Caribbean Sea with Panama, 48 miles in all, constituted a short cut to California, and for a time the road depended almost entirely upon mining traffic.

The extent to which the development of mining in the Western States depended upon railroad building, and the present dependence of many of these railroads upon freight derived from mining, have hardly been recognized until recently. And Dr. Douglas has done more than any other writer to bring about this recognition.

We have referred before to the comparative proportion of freight attributable to mining in the United States and in Canada. These figures are given by Dr. Douglas as 53.09 per cent. of the United States in 1906, and 35.92 per cent. for Canada in 1908. The total mining freight hauled in Canada in 1907 was 56,497,885 tons, and in 1908, 63,019,000 tons. The corresponding figure for the United States (1906) was 435,450,476 tons. In the latter country coal and iron ore are the two most important commodities. Literally, traffic in these articles is the fundament of many thousands of miles of railroads. Conversely, these lines would never have been created but for the industries based upon the manufacture of iron and steel.

Similarly, the metalliferous mines of the United States support largely or in part many individual lines.

These facts are pregnant. Dr. Douglas, while referring to the notable work done by such Canadian lines as the C. P. R., the Canadian Northern, and the Quebec Central in developing the mineral resources of Canada, remarks that our railroads have had less influence in this direction than have those of the United States.

There are several causes underlying this condition. One is, obviously, the relatively sparse population of

the Dominion; another, the limited domestic markets. But, added to these is the indisputable fact that our railroad companies are not alive to the supreme present need of exploiting vigorously our mineral lands. Nor is public sentiment yet healthily aroused.

Not only is it imaginable, but it is highly probable that the Intercolonial Railroad will never become a profitable investment until something over fifty per cent. of the total freight moved on that line arises directly and indirectly from mining. This implies, first, the outlay of sufficient money to provide dockage and handling facilities at important shipping points, and, second, the construction of numerous subsidiary lines to mining centres.

The Grand Trunk Pacific must also embrace every opportunity to cater to the mining industry. The fruits of agriculture provide but sporadic freight. Neither manufactures, forests, nor any other class of freight can begin to supply the constant volume that is derived from mining and metallurgical enterprises.

Briefly, railroads and mining are most closely and more vitally interdependent. The growth of mining reflects itself directly upon the railroads. The extension of transportation facilities brings into being mining districts that otherwise could not exist.

The lowering and standardizing of freight rates, the establishment of loading and handling equipment at shipping ports, the concession of the lowest possible rates to mining pioneers, the construction of much-needed lines in old and new mining districts are themes that should occupy far more of the attention of our railroad magnates. They are themes, also, upon which we hope to have something specifically useful to say in the near future.

Meanwhile we urge upon our Canadian readers the desirability of taking to heart the lessons contained in Dr. Douglas' excellent paper.

### A NEW VANCOUVER COAL MINE.

The Pacific Coast Coal Mines, Ltd., is the name of the company that has recently opened up a coaling port at Boat Harbour, Vancouver Island. Boat Harbour is situated between Nanaimo and Ladysmith, some thirty miles from Vancouver. Here large ocean-going vessels can find ample accommodation. The bunkers are large, and the loading equipment has a capacity of 750 tons per hour.

The collieries are distant seven miles from the harbour. Railroad connection and modern rolling stock are already provided. The company owns 200 acres, and has rights over 5,000 acres in addition.

A large amount of tunnelling has been done already, and production has commenced. The seam at present worked is reported to be from five to twenty feet in thickness. Other underlying seams have been encountered in diamond drilling.

From accounts received it appears probable that the colliery of the Pacific Coast Coal Mines, Ltd., will rapidly become a serious factor in the industries of the Coast. Its equipment is modern, and its product is high-grade.

Competition is needed. We wish the new venture all success. If it can break the prices that citizens of Vancouver and Victoria have to pay for coal, it will have done well.

### THE SPRINGHILL DECISION AND TWO GLACI BAY INCIDENTS.

The report of the Board of Conciliation appointed to enquire into the complaints of the employees of the Cumberland Coal & Railway Company, Springhill, N.S., was made public on July 24. The chairman of the Board was Judge Longley. Mr. Charles Archibald represented the company, and Mr. E. B. Paul the miner.

As regards recognition of unions, the Board's finding is that it should be left to the employers' discretion to decide how far they will recognize organizations having central authority outside of Canada and controlled by interests that may at any moment engage in acute competition with Canadian producers.

The report, temperately and carefully phrased, indicates that the Board does not consider recognition of the U. M. W. A. either necessary or desirable.

As if to lend dramatic force to this report, two incidents occurred in Cape Breton. One was a brutal assault on an old man by the pickets of the U. M. W. A.; the other, an attempt to blow up the house of the manager of one of the Dominion Coal Company's collieries.

For the first incident the U. M. W. A. is directly responsible. As for the second incident it cannot be held guiltless.

We are confident that the U. M. W. A. will not flourish on Canadian soil. The organization proclaims its own unworthiness. Its ways are ways of violence and hate. It glorifies selfishness and is altogether unlovely.

### "THE MINING LAW OF CANADA."

Elsewhere will be found a review of this latest addition to Canadian mining literature. Here we wish to extend an editorial welcome to Mr. Morine's book.

We are grateful to him for saving us further vexation. He has provided a means of choking off importunate enquirers. Heretofore it has been practically impossible to satisfy seekers after light on Canadian law.

Seriously, Mr. Morine has accomplished a large task satisfactorily. His book will become a standard. Mining men need no reminder of the difficulties that the absence of any modern compendium of Canadian mining law has entailed.

### U. M. W. A. METHODS.

The United Mine Workers' Journal, the official organ of the U. M. W. A., is a weekly published in Indianapolis. Its editorial columns are filled with the kind of stuff that incites ignorant men to violence. From casual inspection of its editorials we are led to conclude that its methods are mediaeval.

For instance, in referring to the Glace Bay strike, the U. M. W. Journal of July 22 remarks editorially that the Dominion Coal Company pays a maximum wage of \$1.40 per day. This is so absolutely absurd that it warrants the conclusion that the U. M. W. A. is consciously hard up for an excuse, and that its organ is doing its best to manufacture a colourable story.

Unionism of this kind is not wanted in Canada. As

we suggested in our last issue, deportation of U. M. W. A. agitators is a necessity.

### A CORRECTION.

In our issue of August 1st, page 461, there appeared a statement to the effect that the Cobalt Hydraulic Power Company, Limited, had presumably stopped work at their plant at Ragged Chutes. The Journal has received a communication from the company, in which this report is categorically contradicted, and in which, also, it is stated that work is progressing most satisfactorily.

We are sincerely sorry to have done an inadvertent injustice to any enterprise.

## THE MINERAL EXHIBITS AT THE ALASKA-YUKON-PACIFIC EXPOSITION.

By E. Jacobs, Victoria, B.C.

The mineral department of the Alaska-Yukon-Pacific Exposition, at Seattle, Washington, U.S.A., is on the whole fairly representative of the mining industry of the Pacific Northwest, though it is in a measure disappointing, by reason of the meagreness of the exhibits of some camps that should have made an excellent showing. While this qualification applies to the display of minerals in the Mine Building, it is not applicable to either the Alaskan or the Canadian mineral exhibit, for both these are comprehensive and decidedly creditable to those who had charge of the collection and display of the mineral specimens and associated exhibits gathered together and advantageously arranged in the respective buildings of these countries.

Among the exhibits relating to the mining industry, but not directly connected with the Pacific Northwest, that of the United States Geological Survey naturally occupies a leading position. California and Utah each has in its building a mineral collection worthy of notice, in this respect being unlike Oregon and the several counties of the State of Washington, which have their own separate buildings, but have given little, if any, attention to this section of their natural resources. The only foreign countries other than Canada showing samples of minerals are the South American republics and Japan, and neither of these has a large mineral exhibit.

### Canada's General Exhibit.

As many readers of the Canadian Mining Journal will probably look for prominence being given in this description of the mineral exhibits at the Exposition to those of Canada, these will here have attention. Before dealing with them in particular, though, the general excellence of the whole display of the natural products of Canada will be briefly noticed.

**The Canadian Building.**—An idea of the external appearance of the Canada Building will be conveyed by the accompanying reproduction of a photograph of it. While not centrally situated, it is by no means in an out-of-the-way locality, for it is immediately behind the Music Pavilion, frequent concerts in which consti-

tute one of the more popular attractions of the Exposition. Further, it is in close proximity to two much-frequented walks, one from the south entrance to the grounds, and the other from the steamer landing on Lake Washington.

It will be observed that there are in the Canada Building two main entrance doors. Immediately inside these is the information bureau, while to the right are

CANADA BUILDING.

the women's rest-rooms and to the left the offices of Commissioner Hutchinson and his staff.

**Representative Exhibits.**—Upon entering the exhibit hall, the visitor is impressed by the evident fact that the whole display has been gathered together, placed, and adorned by men who are adepts at their work in this connection. Systematically arranged, attractively displayed, artistically ornamented, and

effectively placarded with terse and cogent statements relative to the staple products of the country, the whole exhibit is a valuable demonstration of the varied natural resources of Canada. In fact, the verdict of the careful observer may, without any exaggeration whatever, be put into words applied by the "Canadian Gazette" to the Canadian exhibit at the Franco-British Exhibition in London, as follows: "As a cleverly thought out advertisement, as an artistic piece of work, as a thoroughly able object lesson in what Canada can do, the exhibition in the handsome white building would be hard to surpass."

A number of alcoves or recesses, some enclosed in glass, occupy the sides of the hall, the central one on each side being much larger than the others. The full length of the far end is taken up by a striking panoramic view showing several stages of progress made by the settler on Western farm lands until he becomes established in a comfortable home; also live stock in grazing country, and rugged mountain scenes. This big picture forms a background for a large group of stuffed Canadian animals and birds, ranging in size from moose and grizzly bears down to small waterfowl. Down the centre of the building are five capacious glass show cases, each 18 feet in length, while arranged along the aisles are 52 glass-covered table cases, these last, as well as some of the larger ones, being filled with minerals.

The interior decorations are chiefly artistic designs in grain on a red ground, these forming a handsome frieze above the exhibits. Numerous transparencies and other coloured pictures show various scenes and phases of life in Canada. Behind the large central recess on one side of the hall is a picture of a river; in front of and across this a representation of a beaver dam has been built, and over the dam a stream of water continuously flows into tanks in which live Canadian beavers are kept as an exhibit of "the earliest known wood-cutters and dam-builders in the world." This very popular scene is flanked by many short logs of pulpwood—spruce, balsam and poplar, arranged in tiers—and by paper and other products manufactured from pulpwood. On the opposite side, the corresponding recess is filled with Canadian fruits, chiefly apples, of which there is a large and attractive display, both fresh and preserved, and having as a background an orchard scene, depicting men gathering apples and placing them in barrels for shipment to market.

A forestry and wood industry exhibit includes Canadian woods in considerable variety—some cut into planks or otherwise fashioned, and stained and polished to show decorative effects for which they are suitable. The fish exhibit consists of many cases of preserved specimens of Canadian fishes, large and small; while the commercial side of the fisheries industry is represented by pyramids of canned fish. Grasses, grains and cereal food products fill two large central cases and four side recesses.

While the sources of the exhibits are indicated by different colours on the labels, showing which provinces the respective exhibits are from, the idea of provincial exhibits is not intruded. On the contrary, the homogeneity and admirable proportion of the whole display is generally well maintained, so that the complete exhibit is essentially a Canadian one, and Commissioner Hutchinson and his staff do not lose sight of this, nor fail to impress visitors with the fact. Said the experienced Canadian Exhibition Commissioner to a newspaper representative: "Just look about this hall and

you will observe that Canada stands out so boldly that no one can be carried away with the idea that this is an exhibition of the products and manufactures of Ontario, Manitoba, British Columbia, or any of the Maritime Provinces. We talk Canada first, and let the rest fall in line." This commendable policy has, however, to some extent been modified as regards the fruit, cereals, and mineral products of Western Canada, for the Exposition being primarily to exploit Western resources, a proper concession has been made to its objects, and the prevailing spirit.

#### The Mineral Exhibits.

The mineral exhibits occupy a total of about 18,000 feet of space, of which more than half has been devoted to those from British Columbia. From its contiguity to the State of Washington, and its consequent nearness to the place where the Exposition is being held, this province, as might be expected, makes by far the largest display in minerals. To detail the numerous mining camps, not to mention individual mines, that have contributed mineral specimens to the Canadian exhibit, would require much more space than is here available. It may be mentioned, however, that not only are the older mining camps—Ainsworth, Slocan, Nelson, Rossland, and Lardeau, in West Kootenay; Fort Steele and other divisions in East Kootenay, and Vancouver Island—generally well represented, but several of those that are comparatively new have gone out of their way to bring to notice through the publicity afforded by the display of samples of minerals at this largely attended Exposition, some of the mineral resources of their respective districts. Among those that have in this way assisted are, Hedley and Princeton, in the big but practically undeveloped Similkameen District; Sheep Creek camp, in Nelson mining division (represented by a large lump of gold-bearing ore from the Nugget mine, information relative to which has lately been much before the public in British Columbia, and the new and promising gold-silver-lead mining camp in Portland Canal District, in the northern part of the province.

Speaking generally, the Canadian mineral exhibit is a very useful object lesson to thousands of residents of the United States who had not previously had opportunity to learn anything from personal observation, of Canada's large and important mineral resources. To many of these the assertion made in connection with the exhibit, that "Canada has a greater variety of economic minerals than any other country in the world," appears more likely to be true when supported by such a comprehensive and really excellent exhibit of minerals as that here made. And just at this time it may be permitted to turn aside for a moment to give credit to Exhibition Commissioner Hutchinson and his zealous lieutenant in the mineral section, W. D. Dalglish, for the comprehensive and representative display of Canadian minerals contained in the collection gathered during a series of years by Canada's Exhibition Branch. Much praise is also due to R. L. Broadbent, of the Geological Survey Branch of the Dominion Department of Mines, for his persistence and good judgment in collecting mineral specimens from the many camps and individual mines he has from time to time visited in the performance of this arduous work. Further, it is an important advantage to have two officials so well posted concerning the minerals of Canada in attendance at the Exposition to give reliable information relative to the exhibits in their particular section of Canada's creditable display of its chief products.

Before passing on to deal in more detail with the various minerals exhibited, it may be well to state that in a number of particulars the exhibit as a striking as well as a creditable one. At the Exposition the claim is advanced that Canada has the best and richest deposits of asbestos in the world, and here is made an imposing exhibit of that mineral, manufactured larger, probably, than nine-tenths of the visitors had ever before seen. Again, in support of the assertion that "Canada has the greatest nickel deposits in the world," there are nickel exhibits that must go a long way toward carrying conviction as to the truth of the statement. Similarly, the pronouncement that "Canada's cobalt-nickel arsenides and silver are now attracting the attention of the whole mining world" is received favourably when there is seen at hand a very large and attractive display of the ores thus referred to. And so on throughout the mineral section; important facts are prominently placarded, and nearby are examples of the mineral products of the Dominion in behalf of which they are stated. One more significant fact should be referred to here, namely, that "Canada's mineral production has increased over 500 per cent. in 15 years."

It may possibly be that in two or three other parts of the Exposition there are bigger collections of minerals; it is certain that in the Alaska Building the large and quite unusual display of placer gold is more fascinating to the general public; but for general excellence and practical serviceableness in attaining the main objects in view in taking part in such an Exposition, it may be claimed, without exaggeration or failing to do justice to other mineral exhibits at the A. Y. P. Exposition, that Canada's mineral exhibit, as a whole, stands first. It may be said of the Canadian mineral exhibit at Seattle, as was said by the London Times of that at the Franco-British Exhibition in London: "The mining industry is exceedingly well represented, and the exhibit is a facsimile of that shown by Canada in the great exhibition at St. Louis a few years ago. American geologists from Washington declared at that time that this display of economic minerals was the best that had ever been collected and exhibited by any country. This can readily be understood when it is taken into consideration that from ocean to ocean the Dominion extends 3,500 miles, and from north to south 1,000 miles."

Taking the various minerals separately, the exhibits are noticed in some detail in the following paragraphs:

**Placer Gold.**—One table case contains about 100 1-oz. samples of alluvial or placer gold, each from a separate creek. Three-fourths of these are from Yukon creeks, a few from the Province of Quebec, and the remainder from British Columbia. Together they constitute a representative collection of samples of Canadian placer gold. They are supplemented by models of most of the large placer gold nuggets known to have been found in the Dominion. That of the largest Quebec nugget, known as the "Kilgour," and which weighed 52 oz., is not included, but the one of the "McDonald" nugget, found in 1866 on Gilbert River. Lot 16 of the De Lery concession (weight 45 oz. 12 dwt., value \$851.26), is among those on exhibition. Other models are of several large nuggets from Cariboo and Cassiar, B.C., and still others from Yukon Territory.

**Lode Gold.**—There are many specimens of gold-bearing quartz from Nova Scotia, Ontario, and British Columbia. Of these Nova Scotia has some of the richest and most attractive, one table case, especially, being

full of beautiful specimens from that province. Samples of ore containing gold are most numerous from British Columbia, which province contributes nearly all of the annual lode gold production of the Dominion. Incidentally, it may be mentioned that by far the greater part of the lode gold produced occurs in combination with copper, and is recovered by smelting; that from stamp-milling usually ranges between 5 and 15 per cent. of the total. Of the gold-copper ores, those from Rossland mines merit notice. These include large lumps of ore from the Centre-Star group, Le Roi, and Le Roi No. 2, the last-mentioned probably carrying highest average gold values.

**Silver.**—Ores containing silver are exhibited in considerable quantity, but in most instances other metals are associated with it. Cobalt-nickel arsenides, from Temiskaming, niccolite, also with smaltite and native silver, from near Haileybury; native silver from Cobalt, and other Northern Ontario ores in which there is much silver, interest many visitors, while the silver-lead ores of British Columbia also make an excellent showing. Ores from both these provinces are prominent features of the Canadian mineral exhibit, and enquiries concerning them are many. As attractive specimens of silver ore, those from Cobalt and neighbouring districts must be placed first, though there are some British Columbia silver ores (notably a large specimen showing much native silver from the Elkhorn mine, Boundary District) that also engage attention. Big blocks of silver-lead ore from the Slocan District are among the latter. There is, too, a case of galena ores from Lake Temiskaming, Quebec.

**Lead.**—Outside, in front of the Canada Building, two unusually large samples of ore, together about four tons in weight, from the St. Eugene mine, in East Kootenay, B.C., are generally noticed. The St. Eugene, owned by the Consolidated Mining & Smelting Company of Canada, Ltd., is the largest and most productive lead mine in the Dominion. During the last five years more than \$800,000 tons of its ore have been milled, from which about 125,000 tons of concentrates, averaging approximately 66 per cent. lead, have been made. Last year's tonnage was the biggest since the mine was opened, while the current year's output will probably be still larger. There is, however, a peculiar fitness in the biggest lead mine in Canada being represented by the largest sample of ore from one mine in the whole of the Dominion mineral exhibit. Other British Columbia mines producing lead also have large samples of ore on exhibition, these being chiefly from Slocan District mines.

**Copper.**—British Columbia also leads in copper ores, whether those of low-grade from the Boundary District, or having associated with the copper appreciably large values in gold and silver, as in the case of ores from Rossland mines, and others from the Coast district. More than half a ton of bornite ore, from the Marble Bay mine, Texada Island, B.C., makes an exhibit of more than ordinary interest, from the fact that this ore was mined at a depth of between 900 and 1,000 feet. There is at that depth a fine body of it, and geologists and mineralogists are finding it necessary to revise their theories as to the non-occurrence at depth of bornite ore. In the Marble Bay mine the silver associated with the copper has increased in quantity as greater depth has been attained. Other bornite ores are from the Cornet mine, also on Texada Island, and from Whitehorse copper camp, in Southern Yukon. A good exhibit of copper gold ore comes from M. K.

Rodgers' Hidden Creek mine, on Observatory Inlet, Northern British Columbia, which mine is now being developed. In the exhibit of the Canadian Copper Co., of Sudbury, Ontario, there are a number of samples of chalcopyrite ores, and a heap of roasted copper-nickel matte. The Colonial Copper Co. has an exhibit of native copper from Cape D'Or, N.S. Chalcopyrite ores from Ontario and Quebec are also shown.

**Iron.**—The mining of iron ore not yet being an established industry in Western Canada, the exhibits of this mineral are neither numerous nor large. British Columbia iron ore deposits are practically unrepresented. Most of the samples of ore and manufactured iron are from Ontario and Nova Scotia, with a few from Quebec and British Columbia. There is some pyrrhotite, both crude and roasted, from Sudbury, Ontario. Eight pigs of iron are shown with some bog-iron ore from Drummondville, Quebec. The Mines Branch of the Dominion Department of Mines, Ottawa, has on exhibition pig iron produced by the electric-thermic process. There are also some magnetic iron sand and chromite concentrates from Quebec. Sections of heavy steel rails, from Sault Ste. Marie, Ontario, are exhibited by the Algoma Steel Co.

**Zinc.**—Not much zinc ore is shown. Among the comparatively few samples are some from mines in the Slocan District of British Columbia, where zinc blende occurs freely in association with galena. Zinc concentrates, also bars of spelter made in the West, are among the zinc exhibits, and, too, some blende from Quebec.

**Nickel.**—The joint exhibit of the Canadian Copper Co., Sudbury, Ontario, and the International Nickel Co., New York, includes copper-nickel ores and heap roasted matte, standard and bessemerized nickel-copper matte, and other nickel products. Besides nickel shot and plaquettes, there are shown many articles made of pure nickel—wire in coils and spools, strips in coils bound with nickel straps and rivets, rods, tubes, trays, coins of the world, chafing dish, etc. The Mond Nickel Co. is also an exhibitor of nickel products. Niccolite, chiefly from Northern Ontario, is among the ore exhibits.

**Other Metallic Ores.**—Among these are cobalt, from Northern Ontario; cinnabar, from Kamloops mining division, British Columbia; molybdenite, from Ontario, Quebec, and British Columbia; tungsten-wolframite, from British Columbia and Nova Scotia, and scheelite, from Cariboo, B.C., and auriferous antimony ore, from Nova Scotia.

**Metallurgical Products.**—Several smelters and other reduction works have contributed exhibits, some of them comparatively large and of considerable value, of metallurgical products.

The Consolidated Mining & Smelting Company of Canada, Ltd., has sent from its smelting works and electrolytic lead refinery at Trail, B.C., lead concentrate, lead anode and cathode, lead pipe, sulphate of copper (bluestone), and other products.

The exhibits sent by the Granby Consolidated Mining, Smelting & Power Company, of Grand Forks, and the British Columbia Copper Company, of Greenwood, both in the Boundary District of British Columbia, contain copper ores, matte, blister copper from their own converters, etc. The Tyee Copper Company, of Victoria, B.C., has contributed from its works at Ladysmith, Vancouver Island, ores from a number of Coast mines, roasted and raw ore and bricks made from ore fines, matte, blister copper, etc.

The nickel-copper exhibits of the Canadian Copper Company, Sudbury, Ont., have already been mentioned. The Syracuse Smelting Works of Canada, Montreal, Que., also made a contribution of products to the Canadian exhibit.

**Coal.**—Prominence is given to the coal exhibits, the bulk of which are in a large show case in the centre of the hall, and on which is displayed the statement that "Coal is King." Another published statement is that "Canada's Coal Areas are Estimated at 100,000 Square Miles."

Samples of Western coal are large, those from individual mines weighing from 1,000 to 1,500 lbs. each. Vancouver Island collieries are represented by exhibits sent by the Western Fuel Co., Wellington Colliery Co., and South Wellington Coal Mines, Ltd., the last-named having only lately commenced production of coal on a commercial scale. From the Middlesboro colliery, Nicola District, the Nicola Valley Coal & Coke Co. has sent an exhibit of coal of good quality, while Southeast Kootenay coal fields are represented by pyramids of coal from the mines of the Crow's Nest Pass Coal Co. and the Hosmer Mines, Ltd., respectively. A similar exhibit of coal from the International Coal & Coke Company's mines, at Coleman, Alta., and some coal briquettes from Bankhead, are all that has been received from Alberta. Samples of coal from Nova Scotia are also shown in the fuel exhibit, which includes as well peat in briquettes, from Beaverton, Ont., and bituminous shale, from New Brunswick.

Coke is from the Crow's Nest Pass Coal Co.'s ovens at Fernie; from Hosmer; from Union Bay, Vancouver Island, and from Coleman, Alberta. With the fuel exhibit is a sample of tar sand, from the Athabasca River.

**Asbestos.**—"Canada produces over 90 per cent. of the world's supply of asbestos" is the claim made in connection with the fine exhibit of asbestos made here. It is stated, further, that in 1900 Canada's production of this mineral was valued at about \$748,000; for 1908 it was nearly \$2,485,000. The considerable quantity of asbestos exhibited makes an excellent display, and that much interest is taken in it is manifest from the number of enquiries made about this mineral. The asbestos shown is chiefly from Thetford and Black Lake, Quebec. The end of one of the large central cases is filled with crude mineral and products manufactured from it, and there are two other exhibits nearby, one of good samples of asbestos and the other of products. Covering for steam pipes and elbows, and for boilers; rope and wick packing; board, fibre, and cement, are the chief asbestos manufactured products included in the exhibit, which is an object lesson to many who had never before seen this mineral in its manufactured state.

**Mica.**—Both Ontario and Quebec show in quantity mica from different parts of those provinces, while British Columbia exhibits some from Tette Jaune Cache, where, however, but little has yet been done towards opening the deposits. "Canada's mica mines could supply the world's demand should occasion arise," is stated with a directness of expression characteristic of most of the claims made in connection with Canada's chief mineral resources, and which do not appear to leave room for much doubt as to their correctness.

**Graphite.**—Exhibits are from both Quebec and Ontario. Beside graphite for lubricating, packing, and other industrial purpose, manufactured products are shown, chiefly large crucibles.

**Corundum.**—Other claims made are that "Canada supplies over 85 per cent. of the world's production of corundum," and that "Canadian corundum is well known in Europe, and is being adopted throughout the world by users of abrasives." In evidence of the latter fact, wheels manufactured in Canada, Great Britain, Belgium, France, Germany, Italy, Russia, and the United States are shown. The corundum exhibited not made into wheels is chiefly from Craigmont, Ontario.

**Hydromagnesite.**—From Mavor, Ltd., of London, have been received, and are on exhibition, a number of magnesite products from Canadian hydromagnesite, these comprising bricks, cupels, furnace linings, etc.

**Other Minerals.**—Three table cases contain mananese ores from Bridgeville, Nova Scotia. Miscellaneous exhibits include feldspar and celestite, from Ontario; baryta, phosphate of lime (apatite), and ferro-limon, from Quebec; mineral paints, from Montreal; a large exhibit of talc, from Madoc, Ontario, and salt in various grades, including table salt in cans as for sale,

GRAND TRUNK RAILWAY BUILDING.

from Windsor, Ontario; pigments, petroleum and products, mineral waters, etc.

In minerals applicable to fine arts and jewellery, and in materials for common and decorative construction, there are some noticeable exhibits. Among these may be mentioned a case of cut and polished stones, chiefly from Nova Scotia, Quebec, and Ontario; a large piece of blue sodalite (a beautiful stone for interior decorative purposes), from Dungannon, Ontario; a strikingly ornamental column of jasper conglomerate, from Bruce Mines, Lake Huron, Ontario; a column of polished red and a curling stone of black granite, both from St. George, N.B., and a column of Kingston granite on a black limestone base. There are also a number of cubes of marble, both mottled and cloudy varieties, yet unpolished, so that their beautiful colours are not as yet apparent. A column of serpentine limestone (resembling Connemara marble), from Grenville, Quebec; two large blocks of gypsum (alabaster), from St. George, N.B., and some polished blue marble, from Botka Sound, Vancouver Island, are also interesting exhibits.

Building materials include some fine stone, among which are many samples of granite, syenite, quartz-andesite, sandstone, limestone, marble (both limestone and lomite), and other rocks, a number of which are from British Columbia coast quarries, though other provinces are also well represented in this division. Fire clay, from Clayburn, B.C., with numbers of fire and other bricks, sections for furnace and coke-oven arches, etc., red brick, cement materials, clays, etc., also in part illustrate the variety of Canada's resources in building and construction materials. Outside the hall a large block of limestone, from Marble Bay, Texada Island, shows the quality of the material there being made into lime in considerable quantity for shipment.

#### Other Canadian Mineral Exhibits.

The Grand Trunk Railway has in its building an excellent display of some of the chief products of Canada, among which minerals supplied by the Canadian Exhibition Branch, are prominent. Some of the prominent features of the mineral section in the Canada building are here duplicated, of course on a much smaller scale, yet the exhibits are attractively arranged and show to advantage. The ornamentation of the interior of this building is also along similar lines to those so successfully employed in the neighboring Canada building, and here, too, transparencies and photographs are used to illustrate Canada, its magnificent scenery and its industrial progress. Notwithstanding that it is necessarily very modest as compared with that made by the Dominion Government, the Grand Trunk System's display together with the building in which it is shown, is a credit to those responsible for it.

The Canadian Pacific Railway Co. has considerable space in an advantageous position in the Exposition Agricultural Building, but since its exhibits are designedly representative of the various districts through which its transcontinental line passes there is little prominence given to minerals. Further, the grains, grasses, and fruits used are more suitable for effective display in small space than commercial minerals. There are, however, some mineral samples shown in the C.P.R. Company's attractive exhibit. Toward the end of July the Vancouver Island Development League placed in this booth a Vancouver Island exhibit, in which there are some minerals. In variety, quantity and importance though, these are insignificant in comparison with mineral exhibits from the Island shown in the Canada building.

#### REPORT ON THE IRON ORES OF NOVA SCOTIA.

The Mines Branch of the Department of Mines, Ottawa, which was organized for the purpose of devoting special attention to the economic features of Canada's mineral resources, has just issued a comprehensive report on the "Iron Deposits of Nova Scotia," prepared by Dr. J. E. Woodman, until recently Professor of Geology at Dalhousie University, Halifax.

This report, which covers very thoroughly the more important iron deposits of the province, consists of 222 pages of text, 63 illustrative photographs, diagrams and maps, and a copious index. The scope and economic importance of the work may be judged from the detailed instructions given to the author, who was requested to give special attention to:—

1. Localities of iron ore deposits so far discovered, and names and addresses of owners.

2. History of development of mines and companies (if any).
3. Geological description.
4. Analyses of ores.
5. In cases of mines which have been worked, output and statistics.
6. Transportation facilities.
7. Limestone in neighbourhood of deposits.
8. State in general terms character of forest in neighbourhood, i.e., whether the supply is sufficient for mining purposes and for the production of charcoal in the event of the introduction of electric smelting.
9. Maps of mines (and drill holes, if any).

The report itself is divided into two main parts:—

Part I. deals with the geographic relations of the deposits, their mineralogy and geology, and questions relating to mining policy, bounties, and mining laws.

Part II. is entitled "Details of Iron Districts," and covers more particularly the ores of the Clementsport Basin, the Nictaux-Torbrook field, the deposits of Hants and Colechester Counties, the ores of the Western Cobequid Mountains and of Arisaig, and the ores of Cape Breton, and is replete with analyses of ores, records of bore-holes and geological sections, and other statistical data.

A second volume, covering iron ore deposits not referred to in Volume I., and devoting special attention to limestones of value for metallurgical purposes, will shortly be issued.

In view of the present condition of the iron ore industry of Canada, and particularly Nova Scotia where so much imported iron ore is being used, this report should be of special value to mining engineers, investors and others interested in the development of the iron resources of this province.

Copies may be obtained on application to Dr. Haanel, Director of Mines, Ottawa.

## MODERN PLACER TESTING.

By G. R. E. Kennedy, Sherbrooke, Quebec.

One method of testing placer ground is the use of the percussion drill. Here, as in sinking for oil, an iron casing, or pipe is driven into the ground by means of a drop weight, working on rope or cable running over a wheel at top of derrick, operated by means of a walking beam and steam or gasoline engine. One driller used by the writer is a Keystone No. 3 traction, driving a 6in. pipe, on the lower end of which is a steel cutting shoe. The machine being placed in position, the pipe is placed in a shallow hole, with earth tramped around it to hold it in place. Then, the drill

core has been drilled to within a few inches of the cutting shoe (in gravel the bit must never be allowed to go below it) the drill is pulled out and the sand pump let in. This, by powerful suction, takes out all the core that has been cut by the drill—in fact, will take out loose gravel without drilling—and this is emptied into a tub and eventually panned, though perhaps first put through a rocker. Then the driving clamps are again put on the bit and pipe driven deeper (new lengths being screwed on as required) and the process repeated until bed-rock is reached, and possibly farther

bit being screwed on to the drill stem and the driving clamps tightened on to the bit, the latter is lowered into pipe, and length of drop fixed and driving begins. The bit and stem weigh about 800 lbs. and with the Jars, 1,000 and drop  $1\frac{1}{2}$  to 2 feet striking around 50 blows per minute. When proper depth is reached, i.e. shortly after pipe gets into gravel, the driving clamps are taken off and the drill let fall inside the pipe, the operator twisting it by hand at each stroke to prevent wedging. This pulverizes the gravel, stones, etc., and cuts through boulders, when encountered. When the

When the hole is finished, a knocking head is put on the pipe (with the drill inside) and pipe is pulled by the exact reverse of the driving process, tools are loaded on to the bed of the machine, and the latter moved to the next position; for the placer has been gone over and laid out in squares, or pests placed to indicate where each hole is to be driven.

Thus, from each hole an accurate test is made. A section of the ground from surface to bed-rock, 6in. in diameter, each 6in. or 12in. as may be, of the core is pumped out or panned, and results entered in the

record book. No slumping in from the sides is possible of rich or poor layers. By putting holes over the entire property, as near together as deemed advisable, say in rows running at right angles to the flow of water, and going from side to side of the placer, and the rows from end to end, the number of cubic yards of gravel is ascertained, the depth of over-burden, the pay-streaks, if such exist, the different lays of gravel, presence of clay, boulders, etc., quality and contour of bed-rock, and average gold values, with a degree of accuracy not possible in any other kind of mining. And from the knowledge of the ground thus obtained, the kind of machinery best adapted can be judged and the cost of extracting the gold content figured on closer than the product of any manufacturing business where market fluctuation introduce an element of uncertainty unknown to the product of the placer gold, the standard of value.

It was the prospecting drill that enabled W. P. Hammon, of Oroville, California, and associates, a dozen years ago, to raise funds for dredges by means of which \$3,500,000 worth of placer gold was extracted from ground, some of it running as low as 12 cents per cu. yd., in one year, 1904. Think of what the cost of testing a large acreage by means of the 49er's shafts would be, and then the uncertainty of figures for same, and the time wasted! There are now between 30 and 40 dredges working around Oroville alone, owned by the Feather River, the Boston and Oroville, Boston Machine Shops, Butte Gold, Lava Beds, Yuba, Cherokee and other companies, some of which have lately consolidated under the management of Mr. Hammon. Probably, had you been offered stock in any of these 12 years ago, you would have smiled a knowing smile and passed by on the other side. Only a few years ago mining investments were looked upon as risky, gambling chances, and to-day a prejudice exists in the minds of those who are not properly informed, especially as to the wonderful improvements in methods and machinery, such as the development of the modern gold dredge from the pan, shovel and sluice.

To-day not a share of these companies' stock can be bought. The ground worked runs as deep as 60 and 70 feet and values from 12 cents to 27 cents per cu. yd.

The returns of a properly equipped dredging enterprise can be predicted with exactness and for years in advance, and this is due to improved prospecting methods.

Its Maker has said that "the earth is full of riches," and who will gainsay it? The rocks of more recent formation contain oil, gas, coal, etc. Older ones contain lead, iron, zinc, etc., and still older ones and their conglomerates carry the precious metals. New and wonderful finds are constantly being made, the world over. No country or section of country has or can have a monopoly of minerals. That some sections seem to have more than others is often because the inhabitants of such localities have the enterprise to investigate and develop the storehouse of wealth under their feet.

And the quickest and cheapest means for such investigation is the core drill, of which there are two kinds, the percussion and the revolving. The percussion drill does not take out a solid core, the other does, (if we except the Empire, of which more later). The revolving core drill is made in different forms, such as the diamond drill, where sharp cornered diamonds are the cutting agency, another with steel or other metal cutting teeth, and another which cuts its channel by revolving the tube upon a layer of chilled steel. But none of these are of use in soft ground, sand, gravel,

etc., and they do not give very good satisfaction in loose, sealy rock, soft coal, etc., though where the ground (rock) is suitable they give excellent results. With the percussion drill, only a perpendicular hole can be made.

The Keystone works very well on ground that it can be run over, but there is a hand prospecting drill, the Empire, that for use on placers, when the ground is soft or not accessible to the more ponderous machine, can be called truly a universal prospecting machine, and the workmanship and finish of it is all that can be desired while on account of its lesser weight, it can be transported to any desired point by man or horse power. The casing that the Empire sinks has a steel cutting shoe, but with teeth, and the casing is revolved by man or horse power, and is therefore, much more easily pulled.

In dredge mining, prospecting has been developed to a science, and the hazard and uncertainty of old methods eliminated, while ground that the 49er would turn up his nose at is made to yield immense returns, even the 49er's abandoned mines and dumps of tailings are worked over and made to pay much better than they did the first time! But in mining, as in many other things, we, in the Province of Quebec are still in 49.

### THE LOST MINE MYTH.

Every mountain range from Maine to Mexico has its mysterious lost mine fable, of which the Pegleg and the Breyfogle in Nevada are perhaps the most famous, for these two are not limited to local liars, but are told by old prospectors and newspaper reporters, from one end of the land to the other, wherever mining items interest. A company has recently been floated, claiming to have recaptured the stray Breyfogle.

Locally, in the Eastern Townships of Quebec, Orford, Stoke and other mountains have their little story, each of a man lost in the hills who picked up a rock to shy at an imaginary wolf, or grabbed a chunk of bed-rock just as he was slipping over a precipice, or uncovered untold wealth under his camp-fire, the melted metal running in tiny rivulets through the ashes (although it would require several degrees more heat than a fire of sticks could produce to melt any of the precious metals, but that is trivial in view of the fact that traces of the fire were afterwards found) but, overtaken by night, got so confused, that, after having found himself, never again could he locate the spot. Or often the exposure and hardships of the night brought on fever and the man died, leaving only his blessing and the story to his family.

In Orford, the find was copper, in Stoke, gold or silver, in Prospect Hill "a nugget as big as the yoke of an egg," strange to say, parted in the middle, half remaining in the ledge and half in the piece broken off. The time and effort spent in the vain endeavor to locate these fairy finds would surprise you. And you might as well argue with a man who thinks a hazel twig has a mysterious affinity to water, when that water is several feet under ground, as to talk sense to one struck with the lost mine mania.

In Emberton, it is the "Lost Stone Mine." and the finder carved an Indian and an arrow on a birch tree, so many paces from a range post. If you doubt the story, for \$5 or perhaps \$50 if you look easy, a native will take you to that post. What better proof do you want of the truths of the tale?

And so round each little mountain range, you will find your old inhabitant with his tale of vanished treasure, which it will be just as well for you to accept, for if you try to use reason, you will find you are up against it.

In one place, a vein of asbestos, with five (5) inch fibre, has crawled into some crevice and pulled the crevice in after it. This was not figured on when the Amalgamated put out its claim to 70 per cent. of known supply, in Quebec.

## The Influence of the Railroads of the United States and Canada on the Mineral Industry.

Abstract of Paper by James Douglas LL.D., Member, to be Read Before the Institution of Mining and Metallurgy.

As our review of the railroads of the continent bears primarily on their influence on mining, it would be interesting to determine whether these combinations affect that industry beneficially or the reverse.

The freight supplied to the railroads by the mines is far in excess of that contributed by any other branch of national activity, as will be seen from the following table:—

| Class of Commodity.           | 1900                                     |                       | 1906                                     |                       |
|-------------------------------|------------------------------------------|-----------------------|------------------------------------------|-----------------------|
|                               | Tonnage reported as originating on line. | Per ct. of aggregate. | Tonnage reported as originating on line. | Per ct. of aggregate. |
| Products of animals . . . .   | 14,844,837                               | 2.87                  | 19,002,825                               | 2.32                  |
| Products of mines . . . . .   | 271,602,072                              | 52.59                 | 435,450,476                              | 53.09                 |
| Products of forests . . . . . | 59,956,421                               | 11.61                 | 92,187,351                               | 11.24                 |
| Manufactures . . . . .        | 69,257,145                               | 13.41                 | 121,457,738                              | 14.81                 |
| Merchandise . . . . .         | 21,974,201                               | 4.26                  | 33,319,615                               | 4.06                  |
| Miscellaneous . . . . .       | 25,329,045                               | 4.91                  | 48,543,902                               | 5.92                  |
|                               | 516,432,217                              | 100.00                | 820,164,627                              | 100.00                |

Mr. Harriman distributes the minerals and metals carried by the railroads of the United States as follows. He says:—

“When we classify the mine products transported on the American railways, measuring the tonnage by that originating on each road, we find that the largest of these products is bituminous coal, of which 206,000,000 tons were transported during 1906. The other products were anthracite coal, nearly 60,000,000 tons; coke, 33,000,000; ores, 69,000,000; stone, sand, and other like articles, approximately 58,000,000; miscellaneous mineral products, more than 9,000,000.

Adding to these the manufactured mineral products we have, petroleum and other oils, 6,500,000 tons; iron, pig and bloom, 21,000,000 tons; other castings and machinery, 13,500,000 tons; bar and sheet metal, 15,000,000 tons; cement, brick, and lime, more than 27,000,000 tons. Besides these, as stated above, the railroads hauled for their own needs more than 100,000,000 tons of fuel and other materials.”

Though the product of the mines constitutes more than half the freight carried by the railroads of the United States, perhaps on that very account—taking the country at large—the rates on that class of freight are very low.

The following extract, from an address I recently gave before the Mining Congress, gives in brief the prevalent rates on coal and minerals in the different sections:—

“In every tariff, coal, coke, and the ores of the commoner metals, which have intrinsically very low value, are carried at very cheap rates. Coal itself is often carried at less than the average cost of transpor-

tation. The Chesapeake & Ohio Railroad reports that its coal rate is slightly over 4 mills per ton mile. The Baltimore & Ohio and the Pennsylvania Railroads, so far as we can gather from their tariff, carry coal at about 3.4 to 3.5 mills per ton mile. The New York Central, whose average freight rate is only a trifle over 6 mills a ton mile, carries coal at between 3 and 4 mills. When we get farther west, where traffic is less dense, rates are slightly higher. In the neighbourhood of Chicago, coal and coke rates are over 4 mills. In the Kansas City region they are about 5 mills. In the Rocky Mountains the cost of transporting coal runs up to between 5 and 7 mills. The same is true of the transportation of ores. Transportation of the iron ores of Lake Superior by rail is somewhere between 4 and 5 mills per mile. In the West, the transportation, I believe, of the ores from Bingham Canon to Salt Lake City, over a very difficult piece of grade, is as high as 7.5 mills per ton mile. But if we take the enormous tonnage which Butte offers to the railroad, we find that the ore is carried for 12c a ton from Butte to Anaconda, a distance of 25 miles (4.6 mills per ton mile), and is carried for just about 4 mills a ton mile from Butte to Great Falls, 176 miles, by the Great Northern. In the southwest we have to charge a little more than that, but railroad transportation on ore from Bisbee to Douglas, a distance of 28 miles, is 20c.”

Mr. E. H. Harriman, in an address before the same American Mining Congress, in Pittsburgh, said:—

“The products of the mines constitute the heaviest freight, and are charged the lowest rate. They are usually non-perishable, and their quick delivery is, as a rule, not urgent, except in a shortage of coal during the winter seasons.

“As a rule, the mine products are more constant in their production than any other large items of freight. As will be seen from the figures given, coal is by far the largest single item; and while the production of coal varies from year to year, only nine times since the beginning of our records of coal mining in the United States (in 1814) has the production of any one year been less than that of the preceding year, the greatest falling off recorded being a drop of 12,000,000 tons in 1894 from the production of 1893.

“On the whole, the increase in production has been so rapid and so marvellous, that on one of the important coal-handling railroads (Baltimore & Ohio) the coal transported during each of the past several decades has equalled the aggregate of that transported by it during all the preceding decades; and the ratio in the increase of production of coal for the entire country has come near following this rule for the past eighty years.

"There has been a correspondingly large increase in the tonnage production of many other important mineral materials, though in some of these the increase has not been so striking as in the case of the coal."

The freight rates on the products of the mines are lower than the average freight rate on all classes, which is computed at .78 of a cent per ton mile, the ton being 2,000 lb. I am connected with a road which runs for 463 miles through New Mexico into El Paso, Texas. It connects a coal field making most of the coke consumed by the copper industries of Southern Arizona, with El Paso, and therefore the proportion of mineral products is above the average, being 63.70 per cent. of the total.

The average freight return is, on all classes, .7253c. On coal and coke, shipped from points east, it receives as its proportion only 5.61 mills. On fuel which originates on its own road, its gross revenue is 6.58 mills.

The inference from these rates would be that a road will receive a higher toll on freight of that description originating on its own road than on the same freight coming from a connecting road. But it enjoys that advantage simply, or only, when and because it is nearer the market, for the market price of such a commodity determines in a measure the cost of carriage.\* The long haul rate is always lower than the short haul.

The long distances over which coal and minerals are carried, illustrates the intimate relation that must exist between mining and transports. Coal from Ohio for consumption at Mesaba Iron Mines must be carried about 800 miles; iron ore from Minnesota to Pittsburgh above 1,000 miles; coal and coke for copper mines in Southern Arizona and Northern Sonora, if from Colorado or New Mexico, is transported 600 to 700 miles; if from the east, 2,000 miles. Copper from Arizona to refineries in New Jersey or Maryland, is subjected to a haul by rail of 2,700 miles; copper from Montana to refineries in the east, to a haul of about the same distance; but British Columbia copper must submit to a journey of 3,000 miles.

The interdependence of the railroad and the mines and the mills on one another, and the great volume of freight carried can best be appreciated by a concrete example. There were nine buildings erected in New York last year into whose skeletons there entered 99,000 to, say, 100,000 tons of structural steel. One of these was the McAdoo Tunnel Terminal, which should be counted as two. If we assume the steel to have been made in Pittsburgh, to make it, 200,000 tons of iron ore were transported from the Mesaba Mines at the extreme western end of Lake Superior—first by railroad, then by steamer—then after a second shipment by rail for 1,000 miles to Pittsburgh. More than 100,000 tons of coal and coke were transported from the Connellsville District to Pittsburgh, and the 100,000 tons of steel were moved first to the construction shops, and thence to the site of the buildings, a distance from Pittsburgh of, say, 300 miles.

These ten buildings, therefore, contributed to traffic in raw material and the finished steel not less than 400,000 tons. The sky-scrapers being erected in every large city of the Union to replace less luxurious and commodious office buildings, and to reconstruct the business portion of San Francisco, account in great measure for the marvellous growth of the iron and steel industry during the last two decades—and a sudden fall in building helps to explain the rapid falling off in the bulk of the traffic.

### Canadian Railroads.

The Canadian railroads have had less influence on the mineral development of the continent than those of the United States, not only by reason of their lower mileage, but of the country through which the first roads were built and the distribution of Canadian mineral deposits. Nevertheless Canada has not been backward in railway building, for, per head of population, she has more miles of railroad than the United States. The population of the United States in 1900 was 76,303,387, and her railroad mileage was 193,345, or one mile to 395 of the population, whereas Canada's population in 1901 was 5,371,315 and her railroad mileage was at that date 18,140, or one mile to 290 per head of population.

The first railroad was a short line of sixteen miles built in 1835 to connect the St Lawrence at Lachine with St. John, and thus secure during the summer months steam communication with New England. This was extended to Rouse's Point in 1850. Other short lines were constructed from inland points to connect with river navigation, making a total mileage in 1852 of only 222. The Great Western, however, in 1852-53 opened its line from Suspension Bridge to London, and in the following year extended it to Windsor. In the same year the Grand Trunk connected Point Levis with Richmond, in Lower Canada, at which point it made connection with its through line from Portland (Maine) to Montreal. The Great Western was subsequently purchased by the Grand Trunk, which thus secured the traffic of the Peninsula—the Garden of Canada.

### The Grand Trunk Railroad.

To-day the Grand Trunk has 3108 miles of single track, and 696 miles of double track; but till the Grand Trunk Pacific was organised and commenced construction, the company never ventured beyond the fertile lands of Quebec and Ontario. The design of the Grand Trunk Pacific therefore bespeaks a complete reversal of the traditional policy of the company, which should make it a worthy competitor of the Canadian Pacific.

A railroad was projected to run from the sea to Quebec, while the boundary between Maine and Canada was in dispute. It even reached the stage of incorporation, for a bill passed the legislature of New Brunswick, authorising the construction of the St. Andrew and Quebec Railroad Company. The settlement of the boundary dispute by Lord Ashburton ceded to the United States that portion of New Brunswick west of the St. John's River through which the proposed railway would have been built, and through which ran the actual post road for the transportation of the mails between Quebec and St. John and Halifax.

It is, perhaps, not strange that the boundary disputes affecting the extreme north-east and north-west frontiers of the British possessions in North America should have excited the building of railroads and influenced their location. In both instances the disputes were settled in favour of the United States. Ultimately both the railroads were built as originally proposed, but the political motive being removed, their construction awaited the demands of trade.

### The Intercolonial Railroad.

The main line of the Intercolonial, 686 miles in length, with its branches and equipment, cost, when opened to traffic, \$21,500,000, not a heavy capital on which to pay fixed charges. Nevertheless, the railroad, as a commercial enterprise, has never been successful.

Government ownership, at any rate in Canada, is not conducive to economy and strict management. The Intercolonial has been helpful to the coal and iron interests of the Maritime provinces. But they have been less helpful to the railroad than coal or iron districts on the continent, for on both the Island of Cape Breton, and on the main land the ore deposits and the fuel are on or close to the seashore. The coal production of the whole Dominion in 1907 was 10,511,426 tons, of which Nova Scotia alone mined six and a-half millions, all of which can avail itself of water transportation, whether to the Western Provinces, to United States, or the West Indies. Vancouver coal, also, is mined near the Pacific.

It is significant of the unsettled character of much of the country through which Canadian railroads run that, in the same sub-division of traffic, 1,460,019 cords of wood are stated to have been transported. (p. 61 of R. R. Statistics for 1906).

The pig-iron industries of Nova Scotia, as well as her coal mines, contributed but little freight to the railroad. The iron ore from the extensive but superficial deposits on Bell Island in Conception Bay, Newfoundland, is loaded directly on ship board, and discharged without railroad carriage on the docks of the Dominion Iron and Steel Company at Sydney. The Nova Scotia Steel and Coal Company's works at New Glasgow are built on an arm of the sea; and the Londonderry Works are within a few miles of an inlet of the Bay of Fundy. In 1906, Nova Scotia mined 5,750,660 tons of coal, and made in her furnaces 366,455 tons of pig iron; but of this production there was carried by the Intercolonial Railroad (p. 140 of Railroad Statistics), only 1,182,128 tons. Her mines and furnaces, however, on this very account, enjoy greater geographical advantages than any others on the Continent. They are as independent of land transportation facilities as those of Great Britain, whose mining and metallurgical industries, situated on or near the sea, were active before railroads were built.

The Intercolonial through the Province of Quebec, as far as Point Levis, clings to the St. Lawrence, where there are no mining operations, and from Quebec westward, to its junction with the Grand Trunk at St. Rosalie, it runs through low swampy or agricultural land. It gave a winter outlet for the coal and iron of the Lower Provinces to Quebec and Ontario, till the Canadian Pacific, with its shorter route and more vigorous management, entered into competition.

#### The Canadian Pacific Railway.

The Pacific Railroad Act, passed in 1872, provided for the creation of a company to build a railroad from the south shore of Lake Nipissing to the Pacific coast. It was to be commenced before July, 1873, and completed before 20th July 1881. Land grants were made of alternate blocks through Manitoba, British Columbia and the North-West Territories, twenty miles deep, not to exceed 50,000,000 acres. The subsidy in money was \$30,000,000. The cost of the line to Lake Nipissing, which was built by Government, was considered as part of the subsidy.

During the same session a number of companies were incorporated to build the whole or sections of the road, one of which, under the Presidency of Sir Hugh Allan, and under the legal management of the Hon. J. J. C. Abbott, was proved to have contributed largely to the Administrator's electoral fund. As a result the

Conservatives were ousted from power by the Liberals under Mr. A. Mackenzie.

The existing Canadian Pacific Co. was thereupon organised, but the road was not completed without further assistance from Government, which at a critical period lent the Company \$100,000,000. This has been repaid.

The railroad was divided into three natural divisions—that from Lake Nipissing to Port Arthur—600 miles, running for some distance not far from the Height of Land between the Lakes and Hudson Bay, through a comparatively barren and rugged country. Second, a level section built for 400 miles through a swampy, well-wooded district, till it entered the woodless prairie in Manitoba, which extends to the base of the mountains. The length of this second was about 700 miles. And third, the mountain section of about 650 miles across the Rocky Mountains to the Pacific.

The first section completed in 1883, was that from Winnipeg to Port Arthur, to which construction material could be supplied at one end by steamers on the lake, and at the other via the branch to Emerson on the United States boundary by the St. Paul, Minneapolis and Manitoba Railroad. A year afterwards the Eastern Division was opened; but it was three years more before the Rocky Mountain Division was completed.

The Canadian Pacific to-day owns 9155 miles of single track and 1209 miles of double track. It has extended its tracks into the Maritime Provinces to the sea; it purchased from the Quebec Government the North Shore Railroad, to reach Quebec, which is the summer port of its Atlantic line of large boats; it runs into Chicago over the Wabash tracks, and from Moose Junction into St. Paul over its own rails, there to connect with the Soo Branch, which rejoins the main line at Sudbury.

It has crossed the Rocky Mountains by a second line through the Crow's Nest Pass, and has built in southern British Columbia, Manitoba, Saskatchewan and Alberta, about 4000 miles of branches.

Its influence of mining in Ontario and in opening up the mineral resources of the West has been momentous. In this respect its benefits were felt before the road was completed. Although many hundred miles of railroad tunnels have been driven through mountains, and thousands of miles of railroad cuts made through ore-bearing rocks, this enormous amount of exploratory work has seldom resulted in exposing ore—even in Chili, in the Cordilleras of the Andes, or in the Rocky Mountains. A railroad cutting, however, by the Canadian Pacific, at Sudbury, revealed one of the large deposits of nickeliferous ore which, with the mines of New Caledonia, virtually supply the world with nearly three-quarters of its consumption of a metal which has become so useful in the arts of both war and peace now that these large deposits permit of its cheap production.

Though the Canadian Pacific main line and its Algoma branch run through mineral-bearing rock, in which the old Bruce Mine, managed by John Taylor & Sons, and the famous Silver Islet Mine were worked no other very large traffic-yielding mineral district except Sudbury has been opened on their main line between the Ottawa and the Rocky Mountains.

But the Timiskaming and Northern Ontario Railway—a road built by the Ontario Government—has aided, if it was not the parent of, the marvellous silver district of Cobalt. When this branch is extended

about 80 miles to Lake Gowganda, it will open up another short strip of the inhospitable country, which may prove the first step towards Labrador. Alaska, Northern British Columbia, and the Yukon were considered worthless, because the farmer denounced them as unfit for agriculture, till the prospector and the miner cultivated them for mineral crops. And the same will probably prove true of that vast forbidding, forested country, the Labrador Peninsula, including the whole ridge between the St. Lawrence water system and Hudson Bay.

But the Canadian Pacific, in supplying the population of the treeless Prairie Provinces with coal, provided the settlers with a commodity as necessary to growth as the land to which it gave them access. British Columbia owes its advancement to the same railroad. There, as everywhere else, the first railroad was hailed as a benefactor, but soon it was cursed as a tyrant, and competition with reduced rates invited. This change of attitude by the customers has been sometimes excusable. But none the less British Columbia owes more than it can now appreciate to the men who built the road at the risk of all they possessed. That it has been successful is due to good management and to the stability of fair rates imposed by the Government of Canada. Under these the mining interests of British Columbia have certainly flourished.

The silver-lead mining commenced in 1886 in the Slocan District, and the first shipments were made in 1887—the year the Canadian Pacific reached the coast. The first shipments of copper were 324,680 lb., in 1894. The shipments in 1907 were 42,900,488 lb. The most productive mines are in the Boundary District, close to the State of Washington. They are making money out of an ore whose average yield is much under 2% of copper, supplemented by a little gold and silver. This has been made possible only through the assistance of the railroad, which to-day is as much a necessary part of a metallurgical establishment as the smelting furnace, for high-grade ores of all the metals, except iron, have become scarce, and the world's demands must be supplied from ores which did not rank as such half a generation ago. The Boundary District is served by both the Canadian Pacific and Hill's Great Northern from across the border. The alternate line of the Canadian Pacific through the Crow's Nest Pass was built to supply the furnaces at Rossland, Nelson and Boundary, with the coal and coke from Fernie and other mines, and ovens in the East Kootenay coal fields.

#### The Canadian Northern Railroad System.

A third trans-continental road, the Canadian Northern, is being built by instalments, and almost without observation. It also has already promoted mining and metallurgy to an eminent degree. It is known as the Mackenzie-Mann Railroad, from the two contractors who originated it by the purchase of a short isolated road in Manitoba, and under whose wise administration it is being expanded as traffic warrants.

The management says:—

"The Canadian Northern is primarily a Western railway. It began in Manitoba and is mainly operating in the Provinces of Manitoba, Saskatchewan and Alberta. Its growth has been phenomenal because the country that has produced it is phenomenal. There was no railway in it before 1880. The total at the end of last year was 6216 miles, of which, after eleven years' existence the Canadian Northern was operating 43 per cent. The growth of other railways in the

prairie provinces averaged 129 miles per annum. The Canadian Northern averaged 246 miles per annum."

While the original road was built westward from Gladstone, its nucleus, a point on a very fertile district 60 miles north-west of Winnipeg, it was extended eastward from Winnipeg to Port Arthur, in Ontario, by a southern route, and in order to pass south of Rainy Lake it had to run for 67 miles through the United States. It therefore opens up territory on both sides of the Line untouched by the Canadian Pacific which, for military reasons, never left Canadian territory and, therefore, was located to the north of the chain of lakes which define the boundary between the two neighbours. The Canadian Northern road re-entered Canada at Rainy River. A branch leaves the main line at Fort Frances for Duluth.

The main line runs through an iron region, the extension northward of the famous Mesaba iron deposits. It contains great possibilities and at least one actual development, the mines of the Atikokan Iron Co., 142 miles from Port Arthur, whose furnace plant has been erected in Port Arthur. The forests are expected to supplement the local freight supplied by the mine.

The Canadian Northern operates 3390 miles in the north-west, of which only 1265 constitutes the main line from Port Arthur to Edmonton; the balance is in branches. From Edmonton it is proposed to approach the Pacific by following the Brazeau River through the Brazeau River coal fields.

But the ambition of Messrs. Mackenzie and Mann seems to be rather to attain success by developing the resources of the country they traverse than to pose as transcontinental magnates. They look to wheat and lumber as fodder for their Western Canadian Northern, and to lumber and mineral for freightage of their road from Winnipeg to Ottawa if they ever build it through. For instead of attempting to span the continent from sea to sea by a continuous railroad, they have built of the Canadian Northern of Ontario only 367 miles to connect the Iron Mines of Moose Mountain with their shipping docks at Key Harbour, on Georgian Bay, and their furnaces at Toronto, leaving a gap of over 500 miles between Port Arthur and the Moose River Mine, and another gap between that point and Ottawa.

The same policy has been pursued in Quebec, the Canadian Northern Quebec Railroad consisting of a road from Ottawa to Montreal, and thence to Quebec through the Laurentian Forest at a distance from the St. Lawrence. Lumber and wood pulp are as yet the principal freight of this section. Riviere a Pierre the main line joins the Lake St. John and Chicoutimi railroad, which has been absorbed into the system, and by which it enters Quebec. This purchased road depends substantially on lumber and wood pulp for its traffic.

The easternmost section is again a fragment, or rather two fragments—a coal road, the Inverness Railway and Coal Co., a line of 60 miles in Cape Breton, a coast line from Halifax to Yarmouth, and a branch from Lunenburg to Port Wade, under the title of the Halifax and South Western Railroad. When the Quebec Bridge actually spans the St. Lawrence River at Cap Rouge, the long gap between that point and the Atlantic seaboard may be built, but the heart of the continent evidently offers a more tempting field to these enterprising men than its rim.

Unless all signs fail, the section west of Port Arthur, which already nourishes the Atikokan Iron Mines and their furnaces at Port Arthur, will stimulate

the search for, and the development of, other iron deposits. The international boundary line, a mere political fiction, cannot have cut from Canada her share of nature's good gifts.

Meanwhile, the heavy expenditure the Canadian Northern is making on the Georgian Bay at Key Harbour, the lake terminus of their Moose Mountain branch, in ore pockets and docks to handle 8,000 tons of ore a day, express their faith in the extent of the iron deposits at Moose Mountain.

The Sudbury deposits and their known northern extension; the opening of these large iron mines in the interval between Sudbury and Cobalt; the extraordinary wealth of Cobalt; and the discovery of minerals of the same class at Lake Gowganda, must encourage railroad building to the northeast, and give courage to the Government, as builders of the Grand Trunk Pacific, and to the enterprising promoters of the Canadian Northern to run their tracks with all speed through the wilderness north of Lake Nipigon.

The Canadian Northern Company claim for the shipment of ore to the United States a certain triangular traffic advantage which is important if it can be carried out. They say that "there is a remarkable strategic advantage in the location of the Moose Mountain Mines. In the first place, they are over 500 miles nearer Cleveland and Pittsburg than the Minnesota ranges, and vessels trading between Duluth, or Port Arthur, and the coal ports of Lake Erie, can load up with wheat for Key Harbour, pick up ore for Cleveland, and return to Duluth or Port Arthur with coal, thus in one round trip handling three great commodities of commerce, whereas in trading between Duluth and Cleveland, it is impossible to handle more than two."

#### The Quebec Central Railroad.

But one of the longest of the second class roads, the Quebec Central, has the distinction of carrying 85% of the world's supply of asbestos. And the same serpentine rocks which yield the asbestos contain chrome iron, about 6000 tons of which in ore and concentrates were shipped last year to the United States. The same road runs through the beautiful Chaudiere valley, which was the scene of a feeble gold excitement a generation or more ago. And had it been built, it might have reversed the ill-fortune which attended the copper mining operations of the English and Canadian Mining Co., under its various re-organisations. For tributary to the road are very large deposits of low-grade copper ores in slates of the Quebec Group, which may be worked to a profit under better methods, and with cheaper transportation than of yore. If that time ever arrives, the eastern division of the Grand Trunk will also derive some benefits from mining, for these copper-bearing slates are widely distributed through the Eastern Townships of the Province of Quebec.

#### Canadian Railroads\* and Canadian Mining.

Postponing the consideration of projected roads in the mineral development of Canada, let us try and gauge the influence of existing railroads. The Canadian Railroad statistics for 1908 have been framed on the pattern of those of the Interstate Commerce Commission of the United States, and, therefore, an accurate comparison can be drawn of the operation of the two national systems.

The distribution of freight in the two countries is as follows:

|                            | United States in 1906.           |        | Canada in 1908. |        |
|----------------------------|----------------------------------|--------|-----------------|--------|
|                            | Tons.                            | %      | Tons.           | %      |
| Products of agriculture... | 70,201,720                       | 8.50   | 9,306,967       | 14.91  |
| Animals .....              | 19,002,825                       | 2.32   | 2,472,358       | 3.92   |
| Mines .....                | 435,450,476                      | 53.09  | 22,626,237      | 35.92  |
| Forests .....              | 92,187,351                       | 11.34  | 12,972,236      | 20.49  |
| Manufactures .....         | 121,458,735                      | 14.81  | 6,655,719       | 10.56  |
| Merchandise .....          | 33,319,615                       | 4.86   | 2,008,267       | 3.18   |
| Miscellaneous .....        | 48,543,902                       | 5.92   | 6,938,135       | 10.09  |
|                            | 820,164,627                      | 100.00 | 63,019,900      | 100.00 |
| United States.....         | 3,652 tons per mile of railroad. |        |                 |        |
| Canada.....                | 2,740                            | " " "  |                 |        |

The growth of the mining industry may be gauged by comparing the freight statistics of 1908 with those of 1907.

They are as follows:—

|                                       | 1907.      | 1908.      |
|---------------------------------------|------------|------------|
|                                       | Tons.      | Tons.      |
| Anthracite (most of it imported) .... | 1,635,128  | 3,735,141  |
| Bituminous coal .....                 | 11,905,068 | 12,320,584 |
| Coke .....                            | 547,303    | 845,767    |
| Ores .....                            | 2,209,860  | 952,353    |
| Stone and sand .....                  | 2,082,336  | 2,538,330  |
| Other products .....                  | 178,985    | 243,004    |

The total freight of all classes carried during those two years were: In 1907, 56,497,885 tons; in 1908, 63,019,000 tons.

The three roads or rather systems, described above comprise as notable a proportion of the Canadian railway mileage, as do the 15 or 16 groups, which we have classified, of the total United States mileage. If we deduct the 9155 miles of the Canadian Pacific, the 3694 of the Canadian Northern, and the 3569 of the Grand Trunk, excluding the mileage of the Grand Trunk Pacific, and add the 1540 of the Intercolonial, we have a total of 17,953, leaving less than 5000 miles to be distributed among 86 small companies, whose average length of track is, therefore, only 52 miles.

In the year 1906, the two products of the mines which gave to the railroads of the United States this large mineral traffic were coal and iron ore. Unfortunately the distribution of her coal mines places the Dominion at a disadvantage compared with her neighbour, for the manufacturing progress of the United States is largely due to the wide distribution of its coal, and that of the Dominion is hampered by the absence of its own fuel from the more populous Provinces. There is none, and none is likely to be found in Quebec or Ontario, and Manitoba possesses only a small field of lignite, the eastern extension of the Souris Basin, which supplies her domestic fuel.

Further west, in the Province of Saskatchewan, a larger area of the same lignite beds has escaped erosion, and in Alberta, south of Edmonton, lignite underlies a territory at least 100 miles from north to south and 100 miles from east to west. The same is known to extend, though to what distance is doubtful, still further north.

Of this grade of coal there was mined in Saskatchewan, in 1907, 153,900 tons, and in Alberta about 600,000 tons. But of the cretaceous coking coal there was also mined in Alberta 547,623 tons, and of anthracite 235,596 tons. This came from the eastern extension of the British Columbia coal fields. It is to reach these that the Crow's Nest Pass Line of the Canadian Pacific has been built, and they are tapped from across the border by Mr. Hill's Great Northern. The production

of coal from these Rocky Mountain mines and from the coal fields on Vancouver Island, reached in 1907, 2,364,898 tons.

The coal fields of the extreme west of the Dominion will supply the needs of an active mining, metallurgical and manufacturing population, and the coal of Nova Scotia and New Brunswick is more than sufficient to reduce the iron of their known deposits, and to keep busy their manufacturing population. But Ontario, which is the centre of Canadian industry, is 800 miles from the nearest western coal, and 500 miles from the coal beds of the maritime provinces.

On the other hand, that busy hive, New England, is in the same sad plight as Quebec and Ontario. It possesses, outside of a small and worthless deposit of anthracite in Rhode Island, no coal, but is dependent for its fuel on the distant coal-fields of Pennsylvania, Maryland and Virginia; and yet coal is essential to the maintenance of its manufacturing position.

These discrepancies and disadvantages are really political and not natural, for the coal of Cape Breton can reach Boston by sea, without any land transportation, and Ontario is divided from the excellent coking coals of Pennsylvania and Ohio by a narrow strip of land and the waters of Lake Ontario. Reciprocity would remove these political obstacles and restore the natural industrial balance if human selfishness did not interfere and obstruct.

As it is, the coal supplied to the railroads of Quebec and Ontario yields them comparatively little traffic, and they would gain more by the impulse which cheaper fuel would give to metallurgy and manufacturing in Ontario and Quebec than they lose by foregoing the carriage, when navigation is closed, of coal from the maritime provinces.

When we turn to the next mineral product, which constitutes part of the 53% of the total traffic of the United States railroads, viz., iron ore, we find a situation analogous to that in Canada with regard to fuel. 75% of the iron ore which makes the 25,000,000 tons of pig ore is transported nearly a thousand miles from Lake Superior to the coals of Pennsylvania, or about 600 miles to the fuel of Illinois and Lake Michigan. That shipped to Pittsburgh has to submit to a railroad haul of over 50 miles to the head of Lake Superior, to be there transferred to ship, and carried for 700 miles to ports on Lake Erie, where it is again transferred to cars to be hauled to the furnaces at Pittsburgh, which has become the most important manufacturing centre of the United States, simply because of its vicinity to the best coking coals of the Republic.

The iron ores of Canada, as we have shown, through the efforts of the Canadian Northern, can now be exchanged across the Lakes for the Pennsylvania coal which Ontario needs. We have seen that the situation of the iron ores and the coal in the maritime provinces favour the metallurgical industry at the expense of the railroads, but the iron ores of Ontario must submit to a long haul, and should afford a source of heavy freight.

#### The Grand Trunk Pacific.

The Grand Trunk Pacific is being built throughout to open up and develop almost unexplored sections of the Dominion. After crossing the St. Lawrence at Quebec, the road, as in the case of the Canadian Pacific and the Canadian Northern, geographically subdivides itself into three sections—the eastern, the middle and the western; but the Grand Trunk Pacific really recognizes only two divisions, the eastern and

the western, for the following reasons. The Dominion Government has undertaken to build as the Eastern Division the road from Moncton, in New Brunswick, to Winnipeg, in Manitoba, and lease it to the Grand Trunk Pacific Co. for 50 years on a rental of 3% on the cost of construction, the rental not to be payable for three years after final construction, and therefore to be due for only 43 of the 50 years. From Moncton, New Brunswick, the road will use into Halifax the Intercolonial Railroad, and the Grand Trunk Pacific will build a shorter line to the sea coast, terminating in St. John, New Brunswick.

Through New Brunswick and eastern Quebec to the Cap Rouge Bridge, where it will cross the St. Lawrence, the new road, though built by the Federal Government, will parallel for long distances its own road, the Intercolonial. But beyond Quebec it will strike north, running within some 60 or 70 miles of James Bay, an arm of Hudson Bay, thence keeping in its course through Ontario to the north of Lakes Nipissing and Nipigon, and far to the north of Lake Superior. It will reach navigation on the Lakes Ontario and Superior by north and south branches, which the Grand Trunk Pacific, not the Government, will build. It is located more or less parallel with the projected Mackenzie & Mann, the Canadian Northern road, until Lake Nipigon is passed; but thence onward to Winnipeg it will open up a wilderness which it is only reasonable that the Canadian Government should assist in exploring.

From Winnipeg the western division is sub-divided into two sections. The first section, the prairie, extends for 916 miles to Wolf Creek, beyond Edmonton. The mountain section extends thence to Prince Rupert on the Pacific, 840 miles. The prairie section is already built straight into Edmonton across the prairie, while the Canadian Northern makes, in connecting these same two towns, a long curve to the north, in order to reach the valley of the Saskatchewan.

The terminus is near the mouth of the Skeena River, by which the road descends to the sea. The town was laid out on picturesque and sanitary lines, in advance of the advent of the track, on a land-locked arm of the sea, constituting a large and safe harbour.

The Government aids the Company in building the western division by guaranteeing the interest on \$13,000 per mile of the first mortgage bonds on the prairie section, and on three-fourths of the cost of the mountain section wherever that may be. The Grand Trunk guarantees the balance of the bonds.

It is a bold undertaking, but not as hazardous as was the building of the Canadian Pacific, when both the agricultural and mineral resources of the northwest were unknown quantities, and the volume of the Oriental trade which would be deflected to the Canadian routes was problematical. This factor of trans-continental traffic will, however, be effected by the Panama Canal. It already feels the influence of the Tehuantepec route.

#### Possible Mineral Resources of North-Western Canada.

The question of prime interest to us is, what the mineral resources of this large slice of the continent penetrated by the Grand Trunk Pacific really are, and whether they are likely to be reached by its main line or branches. The eastern division now being built by the Dominion Government, after leaving Quebec, as we have said, runs along the height of land, and after crossing the affluence of the Ottawa continues almost

to Winnipeg on the Hudson River slope. The recent discoveries in this comparatively unknown land are encouraging. Near Lake Chibogomo, in the Province of Quebec north of Lake St. John, minerals of the useful metals, in what are believed to be commercial quantities, have been discovered in the Huronian rocks. Of the interval between Chibogomo and the silver regions of Cobalt nothing is known.

The millions which have been taken out of Cobalt, since 1903, certainly encourage prospecting. Cobalt owes its discovery to the approach of the railroad which the Ontario Government, desiring to connect by rail the older parts of Ontario with the new, projected, as the Timiskaming and Northern Ontario Railroad from North Bay towards the north. During the construction of this railway the silver veins of Cobalt were discovered, the first finds being within a few yards of the right of way. Further west, nickel ores are known to extend north of Sudbury into the northern range. Iron deposits have been found north of the Moose Mountain; the rocks of the Keewenaw series north of Lake Nipigon are known to be gold and iron bearing. Therefore this section may add largely to the mineral wealth of the Dominion. But the imagination may with reason be given license to run wild in conceiving what the rocks of the extreme north and west of Canada may have kept in store for us.

The railroad will cut across the same ranges which have enriched Montana and British Columbia; which concealed the riches of the Klondyke, and, which it may be assumed, contain the same ores which are already being actively exploited in Alaska. British Columbia made last year in copper, 60,000,000 lb., and Alaska promises from the mines of the Copper River district to again drench the world with a deluge of

copper. It is not, however, the first time within our recollection that that catastrophe has threatened to overwhelm us. A branch line laid out from Hazelton, on the main line of the mountain division, through northern British Columbia and into the Yukon, terminating in Dawson, will, when completed, open up about five hundred miles of this mountain region.

The resources of the Territories of Mackenzie and Keewatin, as well as those of the great Labrador Peninsula, re-christened "Ungava," have never been taken into account. The area of this inhospitable region is startling, and its resources may prove to be so also.

The areas of these unknown sections of the continent are, of the—

|                       |       |                    |
|-----------------------|-------|--------------------|
| Yukon Territory       | ..... | 196,326 sq. miles. |
| Mackenzie             | ..... | 532,635 "          |
| Keewatin              | ..... | 456,996 "          |
| Ungava                | ..... | 349,109 "          |
| Franklin, supposed to | about | 500,000 "          |

If, when the railroad gives access to Lake Chibogomo in Quebec, the prospects do not prove to be delusive, a branch intersecting Labrador will have to be built. Iron deposits of some magnitude are known to exist on the eastern shores of Hudson Bay, but of the resources of the vast territories of the Yukon, Mackenzie and Keewatin we have only vague rumours. Prospectors who have wandered down the Mackenzie tell of great lead deposits exposed upon its banks. We know with some degree of accuracy of the large extent of the petroleum tar sands, constituting in places banks 200 ft. high, from Dr. Bell's report to the Canadian Geological Survey, and from his papers in the proceedings of the Canadian Naturalist and the Transactions of the American Institute of Mining Engineers.

## IRON ORE DEPOSITS OF NOVA SCOTIA.

Notes from Report by Dr. J. E. Woodman, Issued by the Mines Branch, Department of Mines, Ottawa.

In May, 1906, Dr. J. E. Woodman, at that time professor of geology at Dalhousie University, Halifax, N.S. was instructed by Dr. Haanel, Director of Mines Branch, to make as complete investigation as possible of all important iron ore deposits so far discovered in Nova Scotia. Dr. Woodman was directed to deal first with deposits that are favourably situated as regards transportation.

Instead of attempting a rapid and superficial reconnaissance of the whole province, Dr. Woodman selected a few localities and reported upon these in detail. These localities were chosen as being typical of the various methods of occurrence of the ores, and either of present or prospective economic importance. As not all of these districts could be covered in one season, a second report will deal with those omitted from the first.

Part I., General Considerations, includes chapters on the geographic relations of iron ore deposits, the iron minerals, general geology of iron deposits, mining policy, bounties upon native iron ore production, and titles to iron ore.

Part II. presents details of several iron ore districts in the Clementsport Basin, the Nivtaux-Torbrook Basin, the Treassic trap, the Devonian deposits of Hants and

Colchester, the ores of the Western Cobequids, the partly bedded ores of Arisaig and Malignant Cove, the ores of Whycocomagh and Middle River, and of Barachois.

While we cannot afford space even to enumerate the subjects and individual occurrences touched upon by Dr. Woodman, there are several sections that call for more or less extended notice.

Geographic Relations of Iron Ore Deposits.—"With a long coast line and several remarkable national shipping centres, with no part of the country remote from rail communication or inaccessible through topography, the province is especially well situated, . . . providing the best gateway into Canada from Europe for imports or exports, and acting as a manufacturing centre for the West. . . . From the standpoint of manufacture and transportation, what the Atlantic commonwealths are to the United States, Nova Scotia is to Canada."

General Distribution of Ore.—Iron ore is widely distributed throughout Nova Scotia.

On the south side of the Bay of Fundy detached small deposits are found all the way from Brier Island to Cape Blomidon, and on the south shore of Cobequid Bay towards Truro. South of this line of deposits are

the more persistent and important ores of the Clements-port and Nictaux-Torbrook fields.

Detached deposits occur eastward through Pictou County, and through Guysborough County north of the granites and gold-measures. On the south flank of the Cobequid hills is a persistent line of ore bodies stretching into Pictou County. In Antigonish County the large Arisaig field occurs on the coast, and to the south are many small deposits.

In Cape Breton many widely separated deposits have been found, some of commercial promise.

Throughout the province the numerous iron ore deposits are either in close proximity to tidewater or can easily be brought into connection with it.

**Relation to Fuel.**—Like the iron ore, the coal fields of the province are widely distributed, and are capable of supplying fuel at a number of smelting centres. The Sydney and the Glace Bay mines supply the plants of the N. S. Steel & Coal Co., and the Dominion Iron & Steel Co. On the west coast of Cape Breton are the Chimney Corner, Inverness, Mabou, Port Hood, and Richmond fields. In the centre of the province is the

sufficient amount of flux can be obtained for any probable need.

**Possible Smelting Centres.**—From the standpoint of an adequate supply of suitable iron ore, flux, and fuel, with cheap transportation for all these materials to the furnace, and proper shipping facilities for both incoming and outgoing freight, there are four sections that are favourably situated. The cost of labour is uniform throughout the province, and thus does not require consideration.

These four sections indicated on the accompanying map, are:—

(1) A western section in Digby and Annapolis Counties, with the town of Annapolis as its industrial centre.

(2) A west central section, serving Kings, Colchester, and Cumberland Counties, and having Londonderry as a centre.

(3) An east central section, embracing Pictou, Antigonish, and Guysborough Counties, with a focus somewhere in or near the Pictou coal field.

Pictou field. In the Cumberland County field is a line of small collieries stretching from Joggins Mines, on Chignecto Bay, eastwards. Here also are the Springhill collieries. The Londonderry Iron & Mining Co. obtain their fuel chiefly from Springhill and Pictou.

**Relation to Fluxes.**—Limestone on the one hand, and dolomite and ankerite on the other, constitute the two groups of fluxes. The first contains little or no magnesia, the second and third are high in that element. In addition, the ankerite carries a considerable percentage of iron.

The limestones are found in the pre-Cambrian and Cambrian, of Cape Breton, and in the Ordovician, Silurian, Devonian, and lower carboniferous throughout the province. The dolomites occur in the pre-Cambrian; and the ankerite, which is practically an iron-bearing dolomite, is found abundantly in the Londonderry district, and in variable quantity throughout the Devonian area in Colchester and Pictou Counties. In Cape Breton, limestone abounds within reach of shipping.

Only a small proportion of the limestones and dolomites are fit for metallurgical use. But even so, a suf-

(4) An eastern division, including all of Cape Breton, with its centres at Sydney and Sydney Mines.

**Relation to Ore and Metal Markets.**—There appears to be a possibility that Nova Scotia may yet be able to supply Eastern Canadian demands with her own ores. Every ton of iron or steel that can be made from native ores at a cost to meet existing conditions of trade can be sold. Whether or not iron and steel can be made from native ores for export, there certainly will be room in the near future for all the metal that can be produced for manufacturing purposes in Eastern Canada, especially in the Provinces of Nova Scotia and New Brunswick.

(To be Continued.)

#### PEAT FUEL INDUSTRY IN CANADA.

The importance of the peat fuel industry to the central portion of Canada, where coal fuel is non-existent and its importation so comparatively costly, requires no demonstration.

The Mines Branch of the Department of Mines, Ottawa, issued a year ago a report on "Peat and Lig-

nite, Their Manufacture and Uses in Europe," with the object of giving to Canadians as complete a review as possible of this industry in those countries in which it has been most successfully carried on.

This report is now followed by a bulletin entitled "The Investigation of the Peat Bogs and Peat Industry of Canada During the Season of 1908-09," by Erik Nystrom, M.E., Peat Expert. This bulletin comprises 25 pages of text, and includes six large-scale maps of the following peat bogs:—

1. Mer Bleue, near Ottawa.
2. The Alfred Peat Bog, about 40 miles from Ottawa.
3. The Welland Peat Bog, about 6 miles north of Welland.
4. The Newington Bog, on the New York & Ottawa Railway, and about 40 miles from Ottawa.
5. The Perth Bog, a mile and a half from Perth.

6. The Victoria Road Bog, about a mile from Victoria Road station on the Midland Division of the Grand Trunk Railway.

The bulletin contains a descriptive report of each bog, showing the location, area and structure, and giving an estimate of the available supply of peat fuel, with records of analyses, calorific values, etc., and should be of particular interest to those engaged in, or connected with, the development of Canadian peat resources.

A fuel-testing plant is now being erected at Ottawa, in which the value of peat for the production of power gas will be demonstrated, and the Department proposes to carry on a very thorough investigation of this subject.

Copies of the above bulletin and report on peat may be had on application to Dr. Haanel, Director of Mines, Ottawa.

## LEAD SMELTING AND REFINING PRACTICE AT TRAIL, B.C.

From the Bulletin of the Canadian Mining Institute, by A. J. McNab.

(Continued from issue of July 15, 1909.)

The roasting department has six 26' circular H. & H. furnaces, with two more building. These furnaces have revolving hearths, making one revolution in three minutes, and stationary cast-iron rabblers which work the material out of the furnaces in two hours. They have one firebox 6' x 3' on the periphery, the feed coming in the centre, thus gradually approaching the hotter part of the furnace. The material goes into the roasters with from 14 per cent-17 per cent sulphur and comes out with about 8 per cent -8.5 per cent. The capacity is from 38 to 45 tons per day, depending on the amount of sulphur in the material charged and the elimination desired. Our experience is that for good desulphurization in the pots the roast should not have over 9 per cent sulphur, 8 per cent being much better. The temperature of these furnaces must be carefully regulated so that there is heat enough to roast the charge properly though not enough to fuse it, as this will rapidly crust up the furnaces. The roast should consist of small uniform semi-fused globules showing neither lime rock nor ore. The furnaces discharge into the boot of a chain elevator, which drops the roast through a spray of water into a brick bin. This spraying of the roast is a very important part of the process, as it would be impossible to obtain a good product in the pots without doing this, the principal part would then consist of fines which had not fused at all. The function of the moisture (the roast should have about 5 per cent) seems to be a mechanical one, preventing the blast from blowing through too freely, thus making blow holes and localizing the heat. It keeps the heat in the pots until they start to burn uniformly and the temperature gets sufficiently high to insure the fusing of the charge.

The roast is conveyed in cars from the brick bins to iron hoppers over the converters. The lead converting plant consists of 15 converters 8' 8½" in diameter, holding a charge of 10 tons each. The diaphragms used

are cast iron, cast in four sections and bolted together; these sectional diaphragms are much more serviceable than those cast in one piece, as the expansion and contraction is taken up in the joints, and they do not crack. Cast-steel diaphragms were tried, but proved a failure, as the heat bulged them. The converters are operated as follows: A few slabs are thrown into the converters with a shovelful of glowing coals from the firebox of the roasting furnace, a small blast turned on until the fire burns briskly, then the converter is filled from the hopper above, a blast of from 6-8 oz. being turned on and gradually reduced, until when the fire is at the surface and the charge nearly burned only about 2 ozs. is used. Instead of using slabs for starting it can be done with a hot charge, whichever method is preferred. When the charge is burned out, which takes on the average about 8 hours, the converter is dumped and the fused mass falls on a cast-iron cone, which breaks it into several large pieces. These are broken small enough to enter 20 x 20 Blake crusher, which crushes it to a 6" ring. The product is elevated from this crusher and goes direct to the furnace charge bins.

The heat, used in pot roasting is, of course, supplied by the oxidation of the sulphur, iron, etc., in the charge. The reaction between the sulphides, sulphates, and oxides doubtless aids considerably in the elimination of the sulphur, but just to what extent it is difficult even to guess. Some lead is always reduced, the amount varying a good deal, being higher with a high percentage of lead. The function of the lime in the roasting and converting is a much disputed point on which the writer will not venture any opinion. Of course, roasting and converting can be done without any at all. We regularly roast our low grade copper matte with say 15% copper, 27% sulphur, and 56% iron, in an O'Hara or Godfrey furnace, down to 10-12%, and then convert it in H. & H. converters of the usual type, getting a good product carrying from 1-3% sulphur. We also

treat mattes carrying up to 25% lead in the same manner, and obtain a good roast, though the product is more massive and is harder to break. So that if the lime performs any peculiar chemical function it is one that can be performed as well by iron.

The blast furnace plant consists of two furnaces, one 45"x140", with an average capacity of 150 tons of ore per day, one 45"x160", with an average capacity of 170 tons. Another furnace in the process of construction is 45"x215", which we anticipate will put through 240-250 tons of ore daily. In speaking of capacity, we refer to tons of ore, instead of tons of material as is the general practice on this continent. The general practice in this particular, is very misleading, and in fact, conveys very little information, as flux, matte, slag and other by-products might vary anywhere from 15-40% of the charge. For instance, one day our 45"x160" furnace smelted 181 tons of ore, but 261 tons of charge, exclusive of fuel. Another day it made about the same ore tonnage—180—and only made 230 tons of charge. In the first instance the charge carried a lot of by-product, 31%, in the second only 21% with the same ore tonnage. The capacity of the furnace should be figured really on the revenue it produces, and as by-products carry no revenue, they should not be figured.

The furnaces are of the standard type with brick crucibles, and are water jacketed from the crucible to the top of the bosh, above which is a firebrick shaft. The smaller furnace has fourteen 4" tuyères, all in the sides, of the furnace and the larger one has sixteen tuyères. The tuyères are 20" centres; but we are reducing the distance on our new furnace, making it 15" with smaller tuyères. The height of column measured from tuyères to feed floor is 17.5' and the blast used is 32oz. The lead well is of the continuous overflow type and the matte and slag are tapped from the furnace, the matte settling out in a large receiver and the slag overflowing into the granulating launder.

The furnace charge consists principally of H. & H. roast, which is never under 75% and averages 85% of the charge. Besides the roast, the charge carries a small amount of oxidized lead ore and sufficient dry silicious ore and lime rock for the slag desired, also from 100-300 lbs. of furnace slag to keep the charge open and the furnace uniform. The coke averages about 12.5% of the charge, exclusively of slag and easily smelted by-products, varying with the roast and the quality of the coke. The lead in the charge will average about 40%, excluding coke and slag. We have run as high as 45% and with good roast, that is, suitable analysis and low sulphur, no trouble is experienced. But if conditions are imperfect, especially if the sulphur in the roast gets high, trouble begins at once, the slag gets "mushy" and will not run, and if something is not done the furnace will stop. High sulphur is bad at any time, but with a high lead charge it cannot be tolerated, as it is not possible to smelt such a charge economically. For a 40-45% lead charge the sulphur should not exceed 4% and is much better if only 3%. Even with no serious furnace trouble like a threatened freeze-up, the lower the charge in sulphur, the faster it will run for the same analysis, and of course the lower the matte fall, thereby saving money. The difference in speed between a roast of the same analysis, high in sulphur and low in sulphur, is very marked, and a change in the amount of sulphur in the charge, corresponding to a difference of 2% in the matte fall, will easily make a difference of 10-20 tons of ore smelted per day. The sulphur elimination in our blast furnaces,

with a fairly close charge will be from 30-40% due to a considerable extent to reactions between sulphides, sulphates and oxides.

The slag aimed at is a modified  $\frac{3}{4}$  slag,  $\text{FeO} + \text{MnO}$  24—30%,  $\text{SiO}_2$  31—33%,  $\text{CaO}$  18—20%. No attempt is made, however, to follow any definite slag type, as no advantage is apparent from doing so. We try to keep our silica from 31—33%, as we find that by going below 31% we do not gain in speed; in fact, the slag is sticky and does not tap so easily and we can profitably smelt silicious ore to keep it up to this. Above 33%, however, we find it slows up the furnace so that the extra silica is no longer profitable. The  $\text{FeO}$  may vary anywhere from 25—30%, without varying either the speed of the furnace or the slag loss, the lime between 18 and 20%, though the lead in the slag gets less with the higher lime, but the difference is small. We do not like to run our lime higher than 20%, as the breast gets hard. This is dangerous with a fast running furnace as a little carelessness will slag the tuyères. When the charge gets high in sulphur the lime is reduced at once to 17—18%, as lime accentuates any trouble due to "mushy" slag. Also if the slag gets high in zinc the lime is reduced proportionately. The zinc runs from 7—12%  $\text{ZnO}$ , giving us little trouble, if not over 12%. Alumina runs from 8—16% with an average of about 11%, when it gets high (13—16%) it seems to make a heavier, less liquid slag and slows the furnace up, but at no time have we had any serious trouble from this element. In values, the slags average about 0.4 oz. silver per ton and 1% lead.

Usually scrap iron to the extent of 1—1.5% of the charge is used, this helping very materially in the reduction. If this is not used the slags are higher in lead, though the silver content is not raised. There is a tendency to higher slags with a faster running furnace, especially higher values in lead. That is, a furnace putting through 125 tons of ore daily will run cleaner slags than the same furnace running 160. That is, provided the roast and other conditions of charge are not so bad as to prevent reduction. High sulphur in the charge will cause slow running but will also cause high slags. This would not be expected since sulphur is a powerful reducing agent. The reason probably is that a high sulphur charge causes the jackets to crust badly and accretions to form higher up the shaft, making the furnace hang and smelt too high up, curtailing the opportunity for reduction. Our furnace campaigns average 6—7 months. Accretions form on the shaft of the furnace, gradually filling it up, generally beginning on the ends and growing towards the centre. In six or seven months time they have usually grown so that while the furnace may be, and usually is, smelting as much if not more ore than at the beginning with good slags, yet the area of the upper part of the shaft is so restricted that the heat comes up very readily if not carefully fed and increases the volatilization loss so that it is more economical to blow them out. About 70 tons of bullion per day is produced by one furnace. This runs from the lead well into steel coolers, two being provided for each furnace with a capacity of about 3 tons each. The bullion is cooled and drossed here, the dross being skimmed off and put back through the furnace, the bullion is tapped into moulds which make pigs of about 90 lbs. weight; these are sampled and sent in railroad cars to the refinery. An average monthly analysis of the bullion is as follows:—Cu. 22%; Fe. tr., Mn. nil; Zn. 0.098%; Sb. 0.32%; As. 0.28%; Ni. nil; Co. nil; Cd. nil; Bi; 0.0133%; Ag. about 100 oz.; Au 1 oz.;

Pb. 98.5%. Arrangements are now being made to cast the anodes for the refinery direct from the cooling kettles, thus saving remelting.

**Refining Melting Plant:**—The bullion from the smelter is melted in 50 ton steel kettles and pumped by a centrifugal pump into a receiver from which pipes, with plug valves, lead to 10 vertical anode moulds. A 1½" cast iron pump of the ordinary type is used and is driven by a 2 h.p. electric motor. The moulds are filled by opening the valves, the speed of discharge being regulated easily with these. The moulds are of steel, immersed in water to keep them cool, and have a movable head which forms the head of the anode and is lifted out, carrying the anode with it. The head is freed from the anode by the blow of a hammer and reset in the moulds ready for another tap. The anodes are handled from the moulds to cars by a crane; the cars hold ten anodes, set vertically, and are run into the tank room, two cars are placed together, and the 20 anodes lifted off at once by a 10-ton electric crane and placed in the tanks, each tank holding 20 anodes. The cathodes are melted in two 50-ton steel pots; the lead, after skimming, is raised by a centrifugal pump into a receiver, flowing from there by a movable spout into a circle of moulds, making pigs of about 100 lbs. weight. The lead is all moulded into pigs of this size with the exception of that for the Chinese trade, which is made into pigs of a special form, weighing 180 lbs.

The cathode starting sheets are also cast in this building. In the early days of the plant, these sheets were made electrolytically, a thin sheet of lead being deposited on paraffined steel sheets in tanks set aside for this purpose and operated at a low current density. When the deposit of lead was of sufficient thickness, the cathodes were taken out, the sheets stripped off, flattened out, rolled on cathode bars and were ready for use in the tanks. This method was found to be not only costly, but to give weak unsatisfactory sheets. It was found that if lead was poured on an iron or steel plate, with a smooth surface and inclined at an angle, it would chill as it flowed down the plate, giving a nice, uniform sheet, the thickness depending on the temperature of the lead and the angle of inclination of the plate. The starting sheets have now been made on this principle for some years, giving a much cheaper, and a more satisfactory sheet in every way than by the old method. The casting machine is very simple, consisting of a ¾"—steel, surfaced plate the size of the starting sheet, set at an inclination of 1.8 inches per foot. An iron trough of more than sufficient capacity to carry the lead necessary for one sheet is hinged at the other end. Enough lead is ladled from the pot into this trough, which is then turned up so that the lead will flow down the plate, forming the sheet as it flows, the excess spilling over. The sheets are trimmed, very little trimming being necessary, and lifted from the machine on to a car and the machine is ready for the next cast. The sheets are taken into a special room at the south end of the tank department and there straightened and hung on ½"x¾" copper bars by just bending the sheet around the bar once. They are then placed on a car holding 21, sufficient for one tank; of course the sheets are suspended by means of the copper bars from frame work built up on the car so that there will be no danger of them getting bent. These sheet cars are run on tracks between the different rows of tanks and the sheets are put in by hand.

The tank room contains 240 tanks of 3'x8'x3' 6". These are made of 4" coast fir, lined with asphalt and

give very good satisfaction, leaking but little. They are arranged in 6 rows of double tanks, running the length of the tank room, and in three series of cascades; one cascade of nine tanks in length on one side of the pump room launder, and two cascades of six and five tanks in length on the other side. The pump tanks which are near the centre of the building are built of fir, and are asphalt lined, similar to the electrolytic tanks. The solution flows from the last tanks of each cascade in an asphalt lined launder to the lower pump tanks, the pump raising the solution from these into tanks set high enough so that it will have plenty of head to carry it to any part of the building. 1½" hard rubber pipes carry the solution from these tanks to the first tanks of each cascade, ¾" pipes conveying the solution from tank to tank. The circulation enters the tank at the top and leaves it at 7" from the bottom.

Each tank has 20 anodes and 21 cathodes, the latter being a little longer and wider to prevent short circuiting. The tanks are normally operated with a current density of 16 amperes per sq. ft. of cathode area, requiring, with 12% SiF<sub>6</sub> and 5% lead in the solution, a voltage of 0.32 per tank including all contacts. The loss of voltage in the contacts is small, being about 0.02 in all. The anodes are set with 4⅛ inch centres, the cathodes being set midway between. Only one crop of cathodes is taken at present, two having showed no advantage. With a normal current density a tank is worked out in eight days, about 15% of scrap going back to the melting pots. Most of the slime adheres to the anode scrap. This is scraped off in a special tank, the scrap washed and returned to the melting pot. Some slime, of course, falls off in the electrolytic tanks, these being cleaned out once a month. The current efficiency is from 85% to 90%, the losses being due to short circuiting in the tanks, and to floor leakage.

The electrolyte used is, of course, lead fluosilicate with free fluosilicic acid. The average composition will be about 12% SiF<sub>6</sub> and 5% to 6% lead, having a specific gravity of from 1.17 to 1.19. This gives a stable electrolyte, the losses being small. Losses are due to leaks, to solution not worked out of the slimes and to chemical decomposition of the solution, HF and SiO<sub>2</sub> being formed. Some loss is probably also experienced in the evaporation of the wash waters, though H<sub>2</sub>SiF<sub>6</sub> is supposed to concentrate to a high percentage, with no loss at the temperature used. The H<sub>2</sub>SiF<sub>6</sub> used is made at the plant; CaF<sub>2</sub>, H<sub>2</sub>SO<sub>4</sub> and SiO<sub>2</sub> in the proper proportions being mixed and heated in a closely covered, large cast iron pan. The fumes are passed through a series of towers, having at first a spray of water and later dilute acid descending. This H<sub>2</sub>O unites with the fumes forming H<sub>2</sub>SiF<sub>6</sub>, the charge being so proportioned that sufficient HF is generated to dissolve the H<sub>2</sub>SiO<sub>3</sub> formed. The solution is kept circulating until it is of sufficient strength, usually 30% SiF<sub>6</sub>, the little H<sub>2</sub>SO<sub>4</sub> it contains being taken out with lead dross, and the clean acid added to the electrolyte as required.

Under proper conditions, little trouble is experienced in making good lead. An average monthly analysis representing about 2,000 tons is as follows: As., nil; Bi., nil; Zn., .0005%; Ag., 0.0013%; Cu, 0.00075%; Pb., 99.9938%; Fe., 0.00075%; Sn., 0.0001% Sb., 0.0028. The silver runs from 0.1 to 0.5 oz., attributable to small particles of slimes floating over to the cathode settling on the projections of the latter and being plated in. As a general rule, the smoother the deposit, the freer it is from impurities. The first deposit on the sheet is

usually very smooth, getting rougher as the cathode gets heavier. The smoothness of the deposit varies with the voltage, the lower the voltage, the smoother the deposit; it also depends somewhat on the amount of glue used. From .05 to 1 lb. of glue per ton of lead produced is added to the solution daily. The function of this glue does not seem to be understood beyond that a reducing action is required. If no compound like glue is used, the lead deposited will be spongy, soft, and not coherent. In fact, it would be practically impossible to operate, as the tanks would all short circuit within a very short time.

The slime from the tank room is transferred in copper cars, to the wash tanks, and agitated with hot water, the wash waters resulting from this operation being evaporated in steam coil evaporators to the specific gravity of the electrolyte and returned to the tank room. The slimes are practically washed clean, the loss of electrolyte due to retention being very small. After washing, the slimes are filtered, dried in large cars, by being run into the furnace flue, and charged into a water-jacketed reverberatory furnace, lined with magnesite brick. An analysis of the slimes would be Ag., 35%; Sb., 25%; As., 20%; Cu., 8 per cent; with a small amount of Fe, Bi, SiO<sub>2</sub>, and at times traces of Te and Se. The impurities are oxidized off and doré metal 960-975 fine silver + gold, results. This is ladled into moulds and parted with sulphuric acid, the silver being shipped 999 fine and the gold 995. The blue-stone manufactured as a by-product is 99.5%, CuSO<sub>4</sub>, 5H<sub>2</sub>O. At present neither the antimony nor the arsenic are recovered. They were recovered for some months, a year ago, but owing to the fact that the percentage of antimony in the bullion has dropped from 1% to 0.3%, and the price of antimony from 25c. to 7c., it is no longer profitable. However, the plant is arranged that this may be done when conditions require it. The process is as follows: The slimes are boiled

with sodium polysulphide, which extracts from 80% to 90% of the antimony and 50% of the arsenic. The slimes are filtered, the solution electrolyzed in iron tanks having lead sheets as anodes and steel sheets as cathodes using a cathode density of 8 amperes per square foot with a normal voltage of 1.5 per tank. The antimony deposits on the steel sheets and on the tanks, which are also connected as cathode; dense, hard deposits up to 3/4" in thickness being obtained. When the deposit begins to loosen on the sheets, they are lifted out, the antimony scraped off and the sheets returned to the tanks. The antimony contains up to 2% arsenic, which is taken out with alkali fluxes, when it is melted or casting. The solution goes into the tanks with 4.5 grams antimony per 100 cc's, and comes out with from 0.5 to 1 gram. It is then sufficiently concentrated in steam coil evaporators, to make up for any increase of volume of the solution due to the agitation with steam, and used again with the addition of a little more sulphur for treating a fresh batch of slime. During electrolysis some of the Na<sub>2</sub>S is oxidized to sodium thiosulphate; this loss amounts to, about 30 lbs. of 30% Na<sub>2</sub>S per ton of bullion carrying 1% of antimony, if no regeneration is used. Regeneration may easily be effected by crystallizing the sodium salts out of the spent solution and reducing to sulphide with carbon.

The slimes, after treating with Na<sub>2</sub>S, are filtered, roasted in a furnace of the muffle type and treated with 10% H<sub>2</sub>SO<sub>4</sub>, which extracts 90% of the copper and from 10% to 75% of the silver, depending on the thoroughness of the roast. The solution, after filtering, is boiled with copper plates to precipitate the silver, and used again, or if the copper content is sufficiently high, is pumped to the bluestone plant for crystallization and recovery of the copper. The residue is melted in an oxidizing atmosphere with a little coal or silica to break up the PbSO<sub>4</sub>, doré bullion of 505 to 960 fine resulting, which is parted as usual with H<sub>2</sub>SO<sub>4</sub>.

## BOOK REVIEWS.

### A NEW GERMAN WORK ON MINERAL DEPOSITS.

Mineral deposits, and especially ore deposits, have received much attention from writers of books for many years. Comprehensive treatises are to be found in the German, French and English languages. During the last four or five years, for instance, there has been published the well-known book by Dr. Beck, of Freiberg, entitled "The Nature of Ore Deposits." This book has been translated into English by Mr. Harvey Weed. More recently a work of the celebrated economic geologist, the late Professor Stelzner, of Freiberg, entitled "Ore Deposits," was edited and published by Professor Bergeat. These books of Beck and Stelzner can almost be said to be epoch-makers. A third work, entitled "Deposits of Useful Minerals and Rocks, according to form, composition and origin, is now going through the press in Germany.\* It can be considered to be an international work, since its authors are the Director of the Geological Survey at Berlin, and one of the members of his staff, namely, Professors Beyschlag, Krusch and Vogt in their work:—

Norwegian writer on ore deposits, Professor J. H. L. Vogt, of the University of Christiania. This work is to be published in three volumes. The first half of the first volume, entitled "Ore Deposits: General Notes On," has been received. The preface is dated May, 1909.

While this part of the first volume deals only in a general or introductory way with the subject it is of considerable interest. Probably the part of the volume which contains the most original matter is that in which is given the authors' classification of ore deposits. The classifying of ore deposits appears to be always a subject of live interest. Many men have proposed classifications.

The following is the classification to be used by Professors Beyschlag, Grusch and Vogt in their work:—

#### I. Deposits of Igneous Origin.

##### A. Oxide ores.

- (1) Chrome iron ore group.
- (2) Titaniferous-iron ore group.
- (3) Iron and apatite-iron ore group.

##### B. Sulphide ores.

- (1) Nickeliferous-pyrrhotite group.
- Pyrites group.

\*Die Lagerstätten der Nutzbaren Mineralien und Gesteine nach Form, Inhalt und Entstehung.

- C. Native Metal Group.
  - (1) Nickel-iron group.
  - (2) Platinum group.
- II. Contact Deposits.
  - A. Oxide Ores.
    - (1) Iron ore group.
  - B. Sulphide Ores.
    - (1) Lead-zinc and copper ore group.
- III. Veins, Irregular-shaped Deposits, and Metasomatic Deposits.
  - (1) Tinstone group.
  - (2) Apatite vein group.
  - (3) Mercury-silver ore group.
  - (4) Young gold-silver ore vein group.
  - (5) Old gold ore vein group.
  - (6) Lead-silver-zinc ore vein group.
  - (7) Metasomatic-lead-silver-zinc ore group.
  - (8) Antimony ore group.
  - (9) Iron ore vein group.
  - (10) Metasomatic iron ore group.
  - (11) Manganese ore vein group.
  - (12) Metasomatic-manganese ore group.
  - (13) Copper ore vein group.
  - (14) Metasomatic-copper ore group.
  - (15) Pyrites vein group.
  - (16) Metasomatic-pyrites group.
  - (17) Native-copper group.
  - (18) Nickel-copper-arsenic ore vein group.
  - (19) Nickel-silicate vein group.
- IV. Ore Deposits (especially sediments).
  - A. Iron ore group.
    - (1) Lake and bog-ore deposits.
    - (2) Oolitic-iron ore.
    - (3) Coal and clay-iron-stone.
    - (4) Chamosite and thuringite.
    - (5) Magnetite and hematite.
    - (6) Iron-sand deposits.
  - B. Manganese-ore deposits.
  - C. Copper-schist group.
  - D. Fahland group.
  - E. Pyrite group.
  - F. Witwatersrand group.
  - G. Sulphide-lead-zinc group.
  - H. Antimony ore group.
  - I. Group of tinstone and noble metal placers.

This book, like most German works, is well printed. It is curious, however, that while in many respects, especially in binding, German books usually far excel those published in America, the illustrations are on the whole much inferior. Reproductions from photographs

in German books are usually poor when compared with those in the similar class of books in this country.

LITHOS.

**The Mining Law of Canada.** By Alfred B. Morine, K.C., LL.B. 737 pages. Price (half calf), \$7.50. Canada Law Book Company, Ltd., 32-34 Toronto Street, Aoronto.

We have frequently wondered at the absence of an up-to-date hankbook on the mining law of Canada. The need of such a volume has become more and more apparent.

Mr. Morine's book is comprehensive and thorough. The statistics and regulations of the Dominion, and the statutes of Ontario, British Columbia, and Quebec form an appendix.

The following table of contents conveys a fair idea of the scope of the work:—

Chapter I.—Mining Terms and Phrases.

Chapter II.—Part 1, Laws in Force. Part 2, Dominion Legislation. Part 3, Provincial Legislation. (a) Manitoba, Alberta, Quebec, Nova Scotia and New Brunswick; (b) Ontario; (c) British Columbia.

Chapter III.—Part 1, Crown Lands. (b) Indian Lands; (c) Railway Belt. Part 2, Railways and Highways.

Chapter IV.—Capacity to Work, Sell, Lease or License. Part 1, Extent of Rights. Part 2, Capacity to Lease. Part 3, Partnership and Companies.

Chapter V.—Contracts. Part 1, Making. (a) Statute of Frauds; (b) Part Performance. Part 2, Enforcement. (a) Statute of Limitations; (b) Specific Performance. Part 3, Terminating. (a) Rescission.

Chapter VI.—Mining Licenses and Mining Leases. Part 1, (a) Bare Licenses; (b) Profits a Prendre; (c) Leases. Part 2, (a) Parcels; (b) Term; (c) Covenants; (d) Forfeiture and Re-entry; (e) Reservations and Exceptions.

Chapter VII.—Part 1, Easements. Part 2, Fixtures.

Chapter VIII.—Part 1, Employer's Liability.

Chapter IX.—Wrangful Abstraction. Criminal Offences.

Chapter X.—Part 1, Assessment. Part 2, Registration.

Glossary.—Appendix I.—Statutes and Regulations of the Dominion, and Statutes of Ontario, British Columbia and Quebec. Appendix II.—Working Forms.

## INDUSTRIAL NOTES.

The B. Greening Wire Co., Hamilton, have instructed their architect, Mr. W. A. Edwards, of the same city, to prepare plans for a new Wire Rope Factory. It will be a one-story concrete and brick structure, 124 ft. x 112 ft., with saw-tooth roof construction. The flooring will be solid concrete, so as to withstand the weights of heavy machinery and large reels of cable. It will be an up-to-date factory in every respect. Orders have been placed for additional rope machinery of the very latest design. It is expected the new mill will be completed and machinery installed by 1st November next. The present rope mill will be used as an extension of the Wire-Working Branch of the busi-

ness, and will provide much-needed room for the rapidly growing demand for their Wire Guards, Garden Fencing and Bordering, Factory Lockers, etc.

### JEFFREY PROPELLER MINE FAN.

The Jeffrey Manufacturing Company, since placing upon the market its centrifugal fan for the ventilation of coal mines has received many inquiries for a type of fan suitable for developments that do not justify the installation of a centrifugal fan. This led them to investigate thoroughly the action of the ordinary disc fans commonly used in such cases. A prolonged series

of tests and experiments, with a disc fan located at Columbus, developed that the present type of disc fan was inefficient when working against considerable pressure, for the reason that the air forced backward by the resistance would re-enter the fan near the centre of rotation, where the velocity of the blades is very slow, as compared to the velocity at, or near the periphery of the wheel. This action would cause a churning of the air through the fan as a large proportion of the air discharged near the periphery of the wheel would merely flow back through its centre.

It will be noticed by reference to the above cuts, that the Jeffrey Propeller fan is provided with a heavy solid driving disc which prevents the air from re-entering after it has been discharged from the blades of the fan. This feature is a decided improvement over the common form of disc fan and the efficiency of the fan is further greatly augmented by the fact that the air on the intake side is given a centrifugal action near the centre, and is then discharged in a horizontal direction

from the spiral deflecting blades. These blades are riveted between two discs at the most efficient angle, and the outer ends of the blades are drawn in to a spiral shape by adjustable stay rods, so that the blades have practically the same pitch at the outer edge as they have at the periphery of the disc and consequently discharge the air at practically the same velocity over the entire discharge surface of the wheel.

The fan wheel is mounted upon heavy cast iron stands which are bolted down upon a steel base making the equipment self-contained. The bearings are of the double ring oiling type, lined with genuine babbitt and provided with large oil reservoirs which necessitates oiling but once a week.

This fan is well adapted for ventilating small operations and most practical for boosting along feeble currents in larger ones. It is fully illustrated in a neat bulletin No. 23, issued by the Jeffrey Mfg. Co., Columbus, Ohio, which will be mailed upon request.

## SPECIAL CORRESPONDENCE

### NOVA SCOTIA.

**August 4.—The Glace Bay Strike.**—At the time of writing the U. M. W. A. strike at Glace Bay enters upon the fifth week of the most uncalled-for, insensate and wanton struggle that has ever disgraced the annals of labor in Cape Breton.

The output of the Dominion Coal Company's mines for July was, in round figures, 136,000 tons, this being 200,000 tons less than it would have been had wiser counsels prevailed. The loss of output involves a loss to the mining community of about \$200,000 in wages, of \$25,000 to the Nova Scotia Government in royalties, and a loss to the shareholders of the Dominion Coal Company of the profit which would have been earned on a turnover of half a million dollars, which in consequence of the strike, will be diverted to another market, and may not easily be recovered. Three cargoes of American coal have been delivered to the Steel Company at their piers, which adjoin the loading piers of the Coal Company. If the strikers needed an object

lesson in the direct result of their actions upon the coal trade of this island, they have no need to travel far from home to see one.

The final fate of the strikers is indicated by the company's outputs, which have risen from 2,700 tons on the second day of the strike to about 7,000—or half the maximum—at the conclusion of the fourth week. Each day records a steady gain, allowing of course for occasional and local dislocations caused by accidents and holidays, and a steady stream of newcomers are reporting at the mines for work, in addition to which there is a slow returning of strikers to their work.

Our previous estimate of the number of adherents in the mines of the company was 1,700 men and boys. This estimate was confirmed by a parade which was held by the strikers on Saturday, the 31st of July. Some 1,900 men and boys walked in this procession, and it included every man the U. M. W. A. could muster. It also included many men who never worked for

the company in their lives, and some of the "born-tireds" and "never-sweats" who usually attach themselves to parades of this kind. The usual working force of the Coal Company at this season of the year is about 7,000 men. Working about and in their mines, the company have at the present time a daily force of 3,000 men, to which must be added another 1,500 men, employed on the railway, in the shops, and other subsidiary operations of the company in Cape Breton. This leaves 2,500 men unaccounted for, and presumably on strike. The difference between the 2,500 men out of employment and the number who paraded in this procession is 600 men, who are the victims of lawlessness and ceaseless intimidation.

The intimidatory methods used by the strikers are new to Cape Breton. One favorite form of intimidation is the terrorizing of the wives and families of men who are at work, and this at times has reached such a pitch that men did not dare to

years of age, going to his sister's funeral, was slugged into unconsciousness by a U. M. W. A. picket, despite protestations of his sad errand. The U. M. W. A. disclaim officially all connection with these varied forms of outrage, but people comment caustically on the fact that the defence of these people in the magistrate's courts is made by lawyers associated with and paid by the U. M. W. A. The leaders of the U. M. W. have laid the powder-train and fired the bomb; are they not responsible for the results of the explosion? If they call a strike and cannot control the strikers, are they not responsible for the misdeeds of their followers? So far, however, the general public has seen no reason to disconnect the leaders of the U. M. W. A. with the tactics of their followers, and they have seen much to confirm an opposite belief. It is a coincidence, if nothing more, that the happenings which have accompanied strikes of the U. M. W. A. in other parts of this continent should make their appearance for the first time in Cape Breton simultaneously with the calling of a strike by the U. M. W. here, and the presence of U. M. W. leaders in Glace Bay.

As the strike goes along it becomes more than ever evident that it was not a genuine one, but an artificial agitation created and bolstered up by U. M. W. A. money and the trained strike-breeders of this predatory organization. The strike has not arisen out of oppressive grievances, or out of a dissatisfaction with existing conditions, but it is the child of U. M. W. A. politics, and part of a carefully thought-out plan to obtain control of all the mines of Eastern Canada for the United Mine Workers of America. These U. M. W. gentlemen were wise in their day and in their way. They saw and marked well the inveterate attacks which certain Nova Scotian papers from time to time make upon the coal operators of the province, and they evolved a scheme to detach and break up the membership of the P. W. A. through the medium of party politics. This is a weapon which the U. M. W. A. have used many times before to-day, and in the particular instance under review they have displayed astute generalship, having made unconscious and willing catspaws of certain aspiring members of the Conservative party. Whether in the long run the U. M. W. A. are going to dish these political aspirants, or whether the last-named gentlemen are going to dupe the Americans seems uncertain, but between them both it is certain the strikers are going to be shamefully deceived and led astray. Whether the miners who have obeyed the irade of the U. M. W. A. to strike know it or not they have merely been the pawns in a game of political chess. Unfortunately, however, this game has involved the stability of the industrial fabric of this province, and bids fair to discredit for many years the fair name and financial credit of the Town of Glace Bay. But what is this to men who live in Kansas, U.S.A., or thereabouts?

The only serious argument which the U. M. W. A. have yet used to induce men to join them is the value of a big and strong union as a fighting force, compared with that of a small and weaker union. They have used this argument for all it is worth, with all the embellishments which so readily suggest themselves to the wordy demagogue. But is size the real test of the strength of a union? Is not unity the main source of strength in such organizations? We have all seen the loosely-made giant succumb to the attack of a smaller, but compactly knitted opponent. The U. M. W. A. lacks homogeneity and unity. It is full of warring cliques, and ere long will fall to pieces by reason of its own internal dissensions. The larger portions of the coalfields of the United States are non-unionized, and in many of the coal districts there the U. M. W. A. is a thoroughly discredited and impotent body, if it is in existence at all. It is in itself a confession of weakness when a union that boasts of such a large membership as the U. M. W. A., and of funds reaching into tens of millions of dollars (this is President McCullough's statement, not our own) should desert its own proper sphere, migrate to a remote place such as Cape Breton, and fasten itself upon one devoted corporation. Strong and progressive unions do not attack and attempt to destroy

MILITARY GUARD, WITH MACHINE GUN.

leave their families unprotected or exposed to the tender mercies of the strikers and their families, that are more than cruel. Boycotting has been indulged in, and instructions have been issued by the U. M. W. A. locals to boycott tradesmen whose views are suspected to be opposed to those of the U. M. W. A. Threats have been made to the proprietors of boarding-houses whose boarders were at work, and they have been ordered by the U. M. W. A. to turn out all such objectionable persons. All kinds of secret and unmanly intimidation have been resorted to, and in addition there has been open lawlessness, the use of physical force by pickets, and assaults on workmen going to and from their work. As readers of the Canadian newspapers are aware, there has been one serious attempt to dynamite the house of an official of the company, and two other minor attempts of a similar kind on the houses of workmen. One old man, over 76

galler unions. However that may be, this time the U. M. W. have caught a Tartar, as time will prove.

The necessary legal steps were commenced by the Coal company a week ago to obtain possession of some of the company's houses occupied by men on strike, as these houses were needed to accommodate the new-comers who are replacing the strikers. The Glace Bay "Standard," a paper whose policy is dictated by the Mayor of Glace Bay, has taken the extraordinary attitude of advising the strikers that the company's notices quit are not worth the paper they are written on, and has further advised the striking tenants to use all necessary force to resist the officers of the law. This inflammatory advice is including many of the strikers into the belief that the company will not find it possible to evict them from their houses. These men will have a rude awakening, and if there is violence the "Standard" will be largely to blame. The connection between Mayor Douglas and the "Standard" is well known in Glace Bay, and it is not regarded as becoming or proper that the Chief magistrate of the town should be so closely identified with a newspaper which is the avowed organ of the U. M. W. A., whose columns are packed with contemptuous statements with reference to every constituted authority in the land, not excepting the courts, which in the present state of public excitement in Glace Bay, are of an incendiary nature.

Nothing definite has been given out by the U. M. W. A. executive with reference to the Springhill and Sydney Mines situation. To be consistent, a strike should be called at both places. At Sydney Mines the situation is exactly parallel with that which existed before the strike at the mines of the Dominion Coal Company. The U. M. W. A. has been non-suited by the award of a Conciliation Board, which recommended that the union be not recognized. This was regarded as a sufficient cause for a strike at Glace Bay. At Springhill, we understand, conditions are somewhat different. A Conciliation Board there has advised against a strike in the strongest terms possible, and the management of that mine have decided rather to close up and accede to the demands of the U. M. W. A., which as we showed in previous correspondence, were of the most fantastic and extravagant nature. Mr. McCullough, the Vice-President of the U. M. W. A., visited Springhill about the beginning of the first week in August, and he is reported to have threatened a sympathetic strike of the U. M. W. A. at the mines of the Cumberland Coal & Railway Company, and at those of the Nova Scotia Steel & Coal Co., should these companies dare to assist the Dominion Coal Company by supplying their orders. Mr. McCullough has not as yet called a sympathetic strike of the miners in the United States who have recently supplied 20,000 tons of American coal to the Sydney Steel Works. It is not in his power to do this. Yet this gentleman, who is impotent in his own country is allowed to go about Nova Scotia breathing threats against industries which are the very life-blood of our province. This same gentleman, whose business in our country is the destruction of its coal trade, is allowed not only to run his pernicious campaign with impunity, but is able to call upon the civil authorities of this town to afford him protection and to further his nefarious plans. We are a long-suffering people.

Another peculiar feature about this U. M. W. A. strike is the prominence given by the provincial newspapers to the utterances of the leaders, and the mendacious, incendiary, injurious reports with which these papers allow their correspondents to fill their columns. The following sample is from the "Halifax Herald" of the 4th of August, a paper which has several times passed as an accurate and unbiased journal:

"The output of coal is falling back, and it is said that conditions in the mines ARE APPROACHING CHAOS. Men are trying out coal in any sort of fashion, and gear is SUFFERING RIGHTFULLY AT THE HANDS OF INEXPERIENCED OPERATORS."

The capitals are a feature of "Herald" journalism with which all its readers are very familiar. The "Herald" lamely adds a saving clause: "This is report only." Reputable news-

papers do not publish "reports." They are supposed to be papers that disseminate news. Imagine, however, the impression which such a paragraph as that we have just quoted, will create in the mind of an untechnical and impressionable public, to whom at any time a coal mine presents itself as a dreadful and noisome hole which covers all kinds of fearful sights. The unfortunate part of yellow journalism is that the circulation of the paper must be considered before truth and decency, or even before the interests of the province.

Newspaper correspondents have not been content with despatching untrue reports, but one of them at least has taken a prominent part in the agitation, has addressed meetings of the strikers and assisted the leaders of the strike in every possible way. After identifying himself in all things with the U. M. W. A. this gentleman presented himself at the company's office and requested as the special correspondent of the "Toronto Star" that the company would favour him with an exclusive interview on the prospects of the strike from the company's standpoint, and further that he might be allowed to conduct "an impartial investigation behind the colliery barricades." This particular journalist should succeed in his profession. He is better acquainted with journalism than he is with mining, or shall we say, fisheries—but that is another story.

### QUEBEC.

**Sherbrooke.**—Messrs. A. C. Ludlum, president of the New York Engineering Co., one of the foremost builders of gold dredges and placer drillers in America, J. F. McKenzie of Montreal, Wm. Marshall of Toronto, Dr. A. N. Worthington, M.P., G. R. E. Kennedy and Kenneth E. Kennedy spent some time last week on the property of the Compton Gold Dredging Co., at Moose River.

Mr. Ludlum was unable to find any fault with it as a dredging proposition, and expressed chagrin that while looking all over the continent for dredging ground, he should have overlooked such as this, right at hand, and surprise at the apathy and blindness of local capital. Negotiations are now in progress between his company and the Compton Gold Dredging people, and if these and the checking up are satisfactory, Mr. Ludlum says he can put on a dredge by November or December. Otherwise, it will be postponed until spring. Mr. Ludlum also went to Golconda, and will submit a plan for a small dredge to the Golconda Gold Mining Co., that may solve the difficulty there, as there is no question about the gold in the gulch.

By the way, it is amusing to note the look of superior wisdom on the average Sherbrooke man's face when, in reply to his own queries, you tell him there is gold in paying quantities in the Townships, if only modern methods are utilized. He knows a long sight better, or he knows more about it than you do, or he thinks you're batty, or that you're trying to do him—think of it—him! Why, your little companies are not dominated by Messrs. the Local Magnates, nor even advised by their oracles! Go to!

One fellow who watched the party panning on Moe's River exclaimed: "Gosh dum it, is that gold? Why, dad, he useter find that yaller stuff 'n we thought 'twas brass, 'cause there wa'n't no gold 'cept in Californy 'n th' banks."

On Friday the party, accompanied by Mr. F. S. McKay and Dr. A. W. G. Wilson, of the Mines Department, Ottawa, went to Ditton to look at the gold placers there, in autos driven by Messrs. J. McCrear and W. S. Downs. Only two pans of gravel were washed, but the estimated value of the gold contents was high, running several dollars to the cubic yard. The short time available did not allow of any extended examination and the best ground on the broader flats could not be gone over. On the return to catch the New York train, the machines hit only the high places, and no remarks were heard from either the U.S. or Old Country contingent about the slowness of Canadian methods.

The chief known deposits of chromite in Quebec are at Coleraine and Black Lake and the production is steadily increasing. The annual output will soon reach 20,000 tons.

The Montreal Chrome and Iron Co., and the American Chrome Co. are two of the principal operators.

Iron ore is now treated chiefly at Drummondville and at Radnor Forges. As there are extensive known deposits in Wolfe, Sherbrooke, Brome and other counties, the erection of a customs smelter near Sherbrooke is much desired.

Three large granite quarries are now in operation in Stanstead, employing 150 hands.

The Dominion Lime Co. produces a considerable quantity of lime at Lime Ridge, in Wolfe County, at the northern terminus of the Maine Central Railway.

The slate quarries at Rockland, in Richmond County, are being worked extensively and profitably.

Dr. A. W. G. Wilson, of the Mines Department, Ottawa, spent Monday at Golconda, and was favorably impressed with the showing on the placer.

He left town Wednesday morning, in company with Mr. John McCaw, to visit the latter's property at Brompton Lake, and also the old nickel mine belonging to Col. Eustis.

Mr. Wm. Marshall, who came from Montreal some ten days ago, to inspect the property of the Compton Gold Dredging Co., at Moe's River, and went from here to Nova Scotia, was obliged to return last week to Montreal in connection with his case against R. G. Leckie, which has been dismissed, and a civil suit is pending.

Mr. Marshall has become interested in the Compton Gold Dredging Co.

## ONTARIO.

**Cobalt.**—On Friday, July 16th, a discovery of importance was made on the property known as the Cobalt Reserve, which was one of the lots of the Gillies Timber Limit, purchased in the recent sale by Mr. J. H. Waldman, of Montreal. The property was formerly known as Lot No. 22, and is located only one lot distant from the Silver Bar mine. The find was made in the northeast corner of the property and has now been traced for a considerable distance. The vein varies in width up to eight inches, and contains very high silver values, and in many respects it is very similar to the famous surface showings of the Lawson and the Temiskaming & Hudson Bay. Further work on the vein shows that it continues into the adjoining property, owned by O'Brien and Young. This new find has given a great impetus to the work being done on the Limit, and as a consequence the number of men engaged in prospecting has been greatly increased. Another find that is also claiming a great deal of attention is that made recently at the Provincial mine. Up to date the property, which is worked by the government, has made an exceedingly poor showing, and diamond drilling was resorted to in an effort to locate veins. When the hole was down about 120 feet below the surface, high grade ore was encountered. The mineralized area is about three feet wide and in the centre there is a six inch vein carrying high values in native silver.

There is a good deal of active development work going on in the Montreal River Mining Division this summer, and from time to time valuable discoveries are reported. On the diabase ridge that runs from the centre of Smythe Township, several properties have changed hands at a good figure. The most recent sale of importance was the Cleaves claims, which have been purchased by Boston capitalists. The following table, giving the approximate number of boiler and compressor plants, will help to give an idea of the work being done.

### ELK LAKE DISTRICT.

|                              | Boilers. | free air<br>H.P. per minut | Compresso-<br>Capacity<br>Cubic feet |

It is interesting to note that in the Blackburn mine, which is supposed to be about the best in the district, the values are found in the Conglomerate

The Jumbo mine, near Latchford, is installing a 60 horse power boiler and a three drill compressor

The Crown Reserve is putting in several more machine drills.

The Trethewey is starting to put in a concentrator, and the ground is being graded preparatory to building. It is reported that the balance of the treasury stock, amounting to about 45,000 shares, will be issued to the stockholders at par, to defray the cost of erection.

Mr. J. Reynolds, of Goldfield, Nevada, is sorting the Right of Way dump on a royalty basis. It is understood that the mine is to get fifty per cent. of the gross value.

A new vein of high grade ore has been found on the Man property in Gowganda. The vein is only about an inch and half in width, but carries large quantities of native silver.

The shaft of the Painkiller Lake Gold Mining Co., in Munro Township, is down 25 feet and the vein is of good width in the bottom of the working. It is expected that this company will put in a stamp mill next winter.

Some good ore is being taken out of the Rochester from the 65-foot level. The lower workings of the mine are not proving satisfactory so far, so the drills were put on the upper level and some good ore was encountered.

The Beaver is putting on more drills since they started their plant running, and they now have three in operation. Their vein periodically pinches out and then widens again, and when it widens, good ore is usually found.

The Station Grounds Mining Company now has three diamond drills at work prospecting their veins at depth, and the future development will be governed largely by the results obtained. Negotiations are under way to obtain one of the shafts of the Nipissing located north of the T. & N. O. Station. The headworks were destroyed by the recent fire, and if the shaft can be obtained, these will be rebuilt.

At the 200-foot level of the Shamrock mine, a two-inch vein of cobalt was discovered.

Mr. S. D. Maddin has disposed of two lots on the Gillies Timber Limit, known as A12 and A13, purchased in the recent sale, to Messrs. A. Waldman and C. Pierce, of Montreal.

The vein found in the crosscut at the 195-foot level of the Cobalt Lake mine, has widened from three to four inches, and consists of calcite carrying high values in silver.

At the Kerr Lake Majestic, which was recently acquired by the Kerr Lake, a shaft is being started near the shore on the west side of the lake. The shaft will be sunk down through the diabase.

A surface find of some importance has been made at the Foster mine. This property is controlled by the Nevins interest of the Cobalt Central.

Two crosscuts have been started from the 110-foot level of the No. 1 shaft of the Nova Scotia to develop some of the veins recently found on the surface. The shaft started a short time ago on the Bilsky vein is down over 25 feet and the vein in the bottom is about six inches wide.

Good progress is being made on the construction of the Temiskaming mill and the crushing end will soon be completed. This is distant about 300 feet from the main part of the mill, and the ore will be carried between the two places by an aerial tram.

A discovery that means a good deal to the camp was made a short time ago at the Buffalo. The drift on the No. 3 vein at the 200-foot level was run past the contact between the conglomerate and the Keewatin into the latter formation. When in about 75 feet, the Keewatin gave place to Huronian slates and the values came back into the vein. The ore consists of cobalt carrying high values in silver, and the vein is from two to five inches in width.

The failure of the directors of the Coniagas to declare the regular dividend came as a surprise to everyone. A statement has been issued giving as the reason that the money is needed for the improvements to the mill and smelter, and for the purpose of buying custom ores. It is felt generally that this is not the real reason. Last November there was a balance of over \$300,000 in the treasury, and since that time the ore production has been greater than ever before. The mill is in good condition and it is probable that there is not another mine in the camp that has such large ore reserves as the Coniagas.

Some good ore was recently encountered at the 200-foot level of the Green-Meehan, and the condition of the mine seems to be much improved.

A general meeting of the shareholders of the John Black Mining Company and the Black Mines, Limited, was held in Montreal, for the purpose of considering a scheme to amalgamate the two companies. The scheme was adopted by the shareholders, and the new company will be known as the Black Mines Consolidated, Limited. The capital is \$3,000,000, with half a million shares in the treasury. The new company will take up the stock of the old companies on a share for share basis, together with all their property, assets, etc. Besides the two properties in Coleman Township, they hold one claim on the Montcalm River and seven claims in the Gowganda and Miller Lake districts.

The Keeley mine in South Lorraine has encountered a very rich ore shoot at the 125-foot level. The Wettlaufer mine, in the same district, has also run into good ore at the 60-foot level.

Four hundred feet south of the Bilsky vein of the Nova Scotia mine, a new vein was discovered on July 26th. The ore consists of cobalt with small silver values.

Three drills are now working on the Beaver developing the veins and sinking a winze. The winze was started on the main vein and will be continued for 100 feet. This will be the deepest working of the mine and will have a total depth.

In the drift on the main vein of the Peterson Lake lease of the Little Nipissing, the vein widened from a mere stringer to

between four and eight inches of smaltite and niccolite. The drift is on the 160-foot level and is about 400 feet under the lake.

The concentrating end of the O'Brien mill will soon be in a position to start running. There are only 10 stamps to this end, the remaining 30 being used for the cyaniding. The cyanide plant will not be in operation for some time yet, as there are several parts yet to be finished. When the mill is completed it will be the largest in the camp, and will have a capacity of between 125 and 150 tons per day. This property has a small electric line operating between the mill and the different shafts for the purpose of transporting the ore, and the branch to the No. 1 shaft is already completed. The other branches are already graded and are ready to have the rails laid.

In sinking the shaft of the Ophir Cobalt, a blind vein was cut at the 75-foot level. The vein carries good values in native silver.

An important discovery has been made on the Nipissing property near Shaft No. 54. The vein is about ten inches wide, and through the centre there are six inches of cobalt ore carrying very high values in silver. The vein has now been stripped for a distance of 200 feet.

The mill at the McKinley-Darragh is unable to handle the present tonnage and it is proposed to increase the capacity by the addition of ten stamps and the necessary equipment.

The shaft of the Cobalt Central is to be sunk an additional 50 feet. No. 4 vein, which for some time has been carrying small values, has widened out and now carries high grade ore varying in width up to eight inches.

The Silver Cliff is considering the erection of a concentrator. The main workings of the mine are carried on from two tunnels. No. 1 tunnel is now in 370 feet and has to be driven 100 feet more before they cut No. 3 vein, which will be started about September.

**Gowganda.**—Prospecting has been considerably hampered for the past month or so by the flies. People are, however, flocking in again, now that the fine weather is commencing. Shining Tree and Duncan Lake districts are the centre of the rush at present.

A new strike of ore running 5,000 ounces to the ton has been made on the Gowganda Four.

A syndicate of Montreal men, known as the Everett Silver Cobalt Syndicate, have been doing prospecting work on a group of twenty-five claims in the vicinity of Everett and Miller Lakes, which they have under option until September. Three camps have been established, and a force of 100 men are at work.

The preliminary surveys for a branch line of the Temiskaming & Northern Ontario Railway, from Charlton to Gowganda, have now been completed.

Work on the wagon road from Elk Lake to Gowganda has not been making much headway and it is doubtful if the road will be completed before late in the fall.

#### BRITISH COLUMBIA.

**Rossland.**—It is not anticipated that there will be any great delay in the resumption of work at the Le Roi mine, now that Managing Director McMillan is again on the ground, having returned from a successful business trip to London. While it is not expected that heavy shipments will be made for some time to come, yet it is welcome news to men interested to hear that the plan of development is about to be put into operation. Men who are acquainted with the conditions of mining here are quite sanguine as to the outcome of the development of the lower levels of the Le Roi, and believe that large quantities of the rich ore of like character to that recently found on the 1,650-ft. level will be located.

In the Centre Star group of the Consolidated Mining & Smelting Co. of Canada good ore is being opened up in all parts

of the property. New lodes have been located on the 500-ft. level of the Centre Star; while the same level in the War Eagle is producing a heavy tonnage of \$16 to \$22 ore, most of this coming from the main vein. A big body of \$14 ore has been opened up on the eighth level of the War Eagle and the two most important Centre Star veins have been located in the depths of the Iron Mask and Idaho claims, and are yielding part of the output of the mine. At a rough calculation, the gross profits of the Centre Group during June were over \$100,000, and the net profit would be approximately one-third of this figure or over. This is figuring on a liberal charge for smelting, etc., the profit on which this concern also derives from the benefit of its own smelter. In reality the net profit on both mining and smelting operations of the Consolidated in this district are a great deal higher than appears when the operations at the mine alone are figured.

At the Trail smelter another new copper furnace has been put in operation, this being found necessary owing to the growing shipments from the company's own mines, as well as increased quantities of custom ore received. This now gives the Trail plant four copper furnaces and a large lead stack—a total capacity of over 2,000 tons per day. The lead furnace, which has just been fitted with mechanical feed, is capable of treating 250 tons of lead ore per day, producing about 130 tons of bullion. The capacity of the lead refinery is now 100 tons per day. It is the intention of the management of the smelter, however, to continue enlarging and improving the plant as the future points to a heavy treatment of company and custom ore.

A car of picked ore was shipped to Trail from the Hattie Brown mine during the past week. Development work, which is progressing steadily on this property, is making good headway and the results are all that could be expected at this stage of the work.

The shareholders of the Le Roi 2, Ltd., have received a second dividend this year of two shillings per share, while it is thought that further dividends of four shillings per share in all will be paid from the earnings of the mine during this year. Some people would wonder how the Le Roi 2, Ltd. could pay dividends of eight shillings per share when so many other mines hereabouts seem to find it almost impossible to work at a profit. While the monthly tonnage is only about 2,200-2,400 tons, still the average ore shipped goes \$22; the mine is operated on an economical scale, and while the plant is ample for all present work, there is no ponderous machinery lying about idle from which depreciation, etc., must be written off. The magic word, "mine economy," seems to be the open sesame to the Le Roi Two dividend vault. It is almost safe to say, furthermore, that there is little doubt but several other Rossland mines could be paying dividends had they not drifted into debt, etc., in the reckless days of the boom in this district.

**Boundary.**—The outlook for mining in this district during the balance of the year is most propitious. The B. C. Copper Co. now has a small force of men at work getting the mines and smelter in shape for the resumption of work next week. The coke supply is about all that is required to start work with and the trouble between the company and the Greenwood Miners' Union has been adjusted, the union having accepted the scale of wages offered by the Copper Company, and the latter corporation giving the union the same recognition as is accorded it by other operating companies in the Boundary. The B. C. Copper Co. is planning the enlargement of its smelting plant, the first step in this direction being the lengthening of the 20 ft. x 56 in. furnace, 10 feet. The two other copper furnaces in this smelter are 46 in. x 20 ft. Now that the Lewisohn interests have become so markedly identified with B. C. Copper affairs, it is likely that some sort of a working arrangement will be made between the New Dominion Copper Co. and the B. C. Copper Co., whereby the mines will be worked under one management and the smelting operations centralized at Greenwood.

Whether this will take the form of a merger or not has not been decided as yet. The arrangement would be a profitable one for both concerns. Even though the B. C. Copper Co. does not ultimately treat the ore from the New Dominion mines, the smelter will be handling a heavier tonnage than heretofore, as railway facilities will soon be built to the company's Wellington and Central camp mines, tapping the Lone Star mine in Washington as well.

The Granby Co. is preparing for heavy shipments from the Monarch claim of its group which lies south of the Gold Drop. An immense body of ore has been developed in the Monarch by diamond drill, etc., and workings are now being driven on this ore from the Gold Drop, the work being done in such a manner that every advantage will be taken of a gravity haul of nearly 3,000 feet to the huge crusher above the railway tracks. The shipments of ore from this district for the week ending July 10th amounted to 17,837 tons, which it is expected will be about as low as they will get again this year, the shipments for the following week showing a gain of over 2,000 tons, and there now being six of the enlarged furnaces in operation at the Granby smelter and the last two expected to be finished in October, the output will gradually climb until the high record of 34,957 tons for the week ending Feb. 13th will be exceeded. The week ending May 22nd holds the low record for the year with 15,680 tons.

A carload of thirty tons of ore was sent to the Grand Forks smelter from the Little Bertha mine during the past week. No shipments were made by the Golden Eagle since the 60-ton shipment in the early part of the month, and the force has been cut down, temporarily, it is stated.

Considerable surface stripping, etc., is being done on the Snowshoe mine of the Consolidated Company, with a view to increased shipments from this time on. It is likely that "glory hole" operations will be carried on at some of the surface showings.

On the Oro Denoro mine, where diamond drill exploration is being carried on, a new body of ore of considerable magnitude has been located.

A contract has been let to drive a tunnel 400 feet on the Le Roi claim, this district. Two ledges will be cut by this adit, which on the surface carry ore of good value.

**Nelson.**—The Fort Steele Mining & Smelting Co., which, it is understood, is a subsidiary company to the Federal Mining & Smelting Co., the principal bondholder in the Sullivan Group Mining Co., bought in all the mines, smelter and supplies of the last named company at sheriff's sale a few days ago. This will mean the winding up of the affairs of the Sullivan Group Mining Co. and it is likely that the shareholders will get very little to show for their white chip. The creditors of the company are to be provided for in a special stock issue which will be redeemable at par. The Federal Company held about \$225,000 bonds in the Sullivan Company. The smelter is said to be worth nearly \$400,000 and there are about 150,000 tons of ore blocked out in the mine, carrying an average of 15 per cent. lead and 6½ oz. silver.

A force of about twenty men is at work opening up the big copper property on Moresby Island, which A. B. W. Hodges, of the Granby, and associates, are interested in. From present appearances, the Moresby copper deposits will far exceed those of the Boundary, the mining conditions being all that could be asked for. The ore is rich in copper and gold, contains enough lime and iron to smelt well, and then there is the advantage of cheap water transportation to the smelter and market.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Glace Bay.**—What is said to be the first exhaust steam turbine engine in Canada is shortly to be erected in the Central Electric power house of the Dominion Coal Company at Glace Bay. The plant will consist of one 1,000-kw. generating unit. The turbine will be of the Rateau design, impulse type, and will utilize exhaust steam at about atmospheric pressure, or 15 lbs. absolute.

The text of the report of the board of conciliation in the pringhill mining trouble, given out on July 29, is a blow to the United Mine Workers. Judge Longley, chairman, Charles Archibald, for the company, and E. B. Paul, for the men, constituted the board. Recognition of the union, determination of the standard weight of a box of coal, a schedule of prices and a packing system, were the demands. There are about forty thousand words in the report, the general conclusion of which is favourable to the company. Recognition or non-recognition of unions is left to the company, the board finding that the employers should say how far they will recognize organizations having central authority outside of Canada and controlled by interests that may be in acute competition with those of this country. The demand for schedule rates is refused as involving an increase of forty per cent. to those working underground and twenty-eight per cent. to surface men. The losses of the company on three years are said to have been \$300,000, and under the circumstances the board thinks it unreasonable and impracticable for employees to expect increased rates. Strained relations between the management and the men have resulted in 26 strikes in 22 years, and the board thinks the directors should look into this. While Mr. Paul agrees in the main with the conclusions, he submits a memorandum to the effect that recognition of the United Mine Workers local would allay friction. He thinks also, there should be a rate schedule.

### ONTARIO.

**Ottawa.**—The increased trade development and improved financial conditions are resulting in a greater demand for the exchange of silver and copper at the Royal Mint. Just at present the institution is undergoing repairs, but an unusual amount of activity is promised when it resumes next month. Very little gold so far has been refined, but a contract has been let for a refinery building. When this is completed a bigger gold coinage is expected.

At the Finance Department it is stated that the arrangements are practically completed with the banks for the redemption at 75 per cent. of face value of plugged coins. The Receiver-General will redeem them through the medium of the banks.

**Cobalt.**—The two parallel veins on the Peterson Lake lease of the Kerry Mining Company look well, and good ore is being

taken from them. Seventy feet of drifting has been done on the one and fifty on the other. The shaft on the property is now down 200 feet.

**Sault Ste. Marie.**—A Michipicoten iron ore deposit has been purchased by the Lake Superior Corporation from a group of Michipicoten owners.

### BRITISH COLUMBIA.

**Phoenix.**—The Greenwood-Phoenix tunnel is in 200 feet and advancing three feet per day by hand labor.

**Kaslo.**—Four hundred tons of zinc ore were shipped from Kaslo during the second week of July.

**Nelson.**—The rehabilitation and restoration to the shipping list of the best known silver-lead properties on Kootenay Lake, the Highland and the Buckeye, which have now been amalgamated to be known as the Highland-Buckeye, which made its first shipment for some years past to the Consolidated Company's smelter at Trail last week, means much to the Ainsworth camp and the Kootenay district generally.

The property has only been owned by its present operators, a New York syndicate, of which J. S. Airheart is manager, since June 5th last. Already rapid progress has been made in the way of cleaning things up around the mine and in getting the mill, having a capacity of 200 tons, into readiness for operation.

The mine is situated two miles north of Ainsworth at a height of about 2,000 feet above the lake and about one mile from the shore, where is located the mill, which is connected with the mine by means of an aerial tramway.

Since the property was taken over last month from W. J. Wilson and associates it has been worked to its fullest capacity and is now in a position to make regular shipments. The shipment which will go forward this week will be crude ore, which is expected to run between 60 and 70 per cent. lead and between 25 and 30 ounces of silver.

A large force of men are employed at the mine and now that shipments have been resumed, the staff will be considerably increased.

The Highland is one of British Columbia's most famous mines, having in 1903 been the largest shipper in the province, while in the following year it was second only to the St. Eugene.

A good showing of ore has recently been located in the No. 2 tunnel, where it had been lost by the previous operators of the property, and good bodies of ore are also being worked in the No. 1 and No. 3 tunnels.

The future development of the Highland-Buckeye will be watched with a good deal of interest by Kootenay mining men generally.

## MINING NEWS OF THE WORLD.

### GREAT BRITAIN.

The Scottish coal owners decided on July 8th to post notices forthwith intimating a reduction of wages by 12½ per cent. on the 1888 basis, dating from July 26th. It is possible that a peaceful solution of the difficulty may yet be reached. In any case it is expected that no sympathetic strike will occur in the Welsh and English fields, in the event of the Scottish Miners' Federation calling out the men.

For the first six months of 1909, the returns of the Welsh coal trade show 12,909,950 tons exported, as compared with 12,272,540 tons in 1908. The figures for June are 2,037,599 tons, as against 1,876,563 tons for June, 1908. The highest price for best Cardiff coal in June, 1908 was 16s. 6d., the lowest, 16s. The corresponding figures for this year are 22s. and 16s. 6d.

The special conference of the Miners' Federation of Great Britain to receive the result of the ballot which has been taken

in the mining districts throughout England, Scotland and Wales as to whether there shall be a general stoppage in the event of the Scottish coal owners persisting in giving notices to their workmen, was held in London on July 28th.

So overwhelming has been the vote for a general stoppage in support of the Scottish miners that the preventing of a strike at practically all the coal mines of Great Britain depends now upon the success of the Board of Trade negotiations for a settlement.

Opinion on that critical point is divided, though the best opinion in the Federation is that a settlement will be effected without a stoppage. It may be stated that the Scottish delegates are not so optimistic as their English colleagues as to the prospect of an immediate settlement. In the opinion of Mr. Smillie, the President of the Scottish Miners' Federation, the outlook is very bad, but this pessimistic view of the situation is not shared by others who have taken part in the joint conferences. There is a reasonable prospect of a settlement. Mr. Askwith, K.C., who presided at the second meeting of the Board of Trade on Friday and at Glasgow on Tuesday, has proved a skilful mediator, smoothing away points of difference and suggesting points of concession and agreement.

The conference began its sitting at two o'clock, and the proceedings lasted for less than an hour and a half. Mr. W. Abraham, M.P., South Wales, presided in the absence through illness of Mr. E. Edwards, and there were present 130 delegates.

The proceedings were private, but at the adjournment Mr. A. Stanley, M.P., presented the following official report:

"The conference is called specially to receive the result of the ballot taken of the members upon the question whether or not the whole of the Federation shall put into operation the twentieth rule and declare a general stoppage in sympathy with the Scottish miners in their determination to resist a demand of the Scottish coal owners for 12½ per cent. reduction in wages. The result showed that 518,361 had voted for a general stoppage and 62,980 against, giving a clear majority for a stoppage of 455,381."

The deputation who had been appointed by the Federation to assist in the negotiations before the Board of Trade and also with the Scottish coal owners on the matter gave a report of these transactions, and the following resolutions were carried unanimously:

"That unless a satisfactory settlement be arrived at tomorrow with regard to the Scottish dispute, notices be given in all districts to terminate contracts to end on the last day of August.

"That in view of the ballot of the Federation being so strongly in favour of a general stoppage, financial support equal to 10s. per week be paid to the Scottish miners during their preliminary stoppage, and that the carrying out of this resolution be delegated to the Executive Council."

The thickest seam of coal proved in Kent was discovered on July 23rd in one of the borings between Canterbury and Dover at a depth of only 1,459 feet from the surface. The seam proved to be 5 feet 9 inches in thickness, some fine samples of clean, bright coal being brought up in the large core barrel. This is the fourth seam discovered in the same boring.

#### UNITED STATES.

On coal the duty has been decreased from 67 cents a ton to 45 cents. Last year from the Maritime Provinces and British Columbia mines there was shipped to the New England and Pacific States markets coal to the value of \$4,041,562. The reduction of the duty on coal is one of the most important features of the new tariff from the Canadian standpoint. The placing of hides on the free list is also likely to be of material benefit to Canadian exporters. Last year Canada exported to the States hides to the value of \$1,308,551.

The reduction in the duty on agricultural implements from 20 per cent. to 15 per cent. is hardly likely to have any effect on

Canada. The American market can be controlled by the American manufacturers in any event. Last year our exports of agricultural implements to the States amounted to only \$15,459.

#### MEXICO.

A gigantic steel plant will be established in Mexico City within the coming year by French and American capital. The initial outlay will be \$50,000,000.

Victor Belanger, of Paris, is the head of the concern. It is understood that a part of the capital will come from Paris and Boston. Coal and iron mines in Buffalo will be acquired later by the company. The steel will be manufactured by a new and secret process.

#### SOUTH AFRICA.

The directors of the City Deep, Ltd., have offered a handsome bonus to the Victoria Falls and Transvaal Power Company Ltd., to supply power this month, thus accelerating production by some three months ahead of what has been anticipated.

According to official returns, the value of the mineral output of the Transvaal for the half year which ended on 30th June last was £16,723,785, of which gold represented £15,472,409, and diamonds £580,807. The total decrease, as compared with the previous half year, was £114,010, of which gold accounted for £57,403 and diamonds for £133,682. Coal and other mineral showed an increase of £79,348, while silver decreased by £2,268.

#### AUSTRALIA.

The value of the mineral exports from New South Wales for the half year ended 30th June was as follows: Silver £86,199; silver-lead concentrates, £480,575; lead matte, £91,679; copper, £296,750; tin, £142,049; coal, £1,193,042.

The discovery of rich gold-bearing ore at Ballarat has been officially reported to the Government. The strike runs in northerly direction, almost under the centre of the city. The fact that most of the operations have hitherto been carried on in southerly direction enhances the importance of the discovery.

## Company Notes.

The Coniagas, which passed its last dividend, as a matter of policy rather than necessity, has paid the following dividends since its inception:—

| Date.                 | P.C. | Bonus. |            |
|-----------------------|------|--------|------------|
| 1907—May 1 .....      | 2    |        | \$80,00    |
| June 1 .....          |      | 1      | 40,00      |
| July 1 .....          | 2    |        | 80,00      |
| September 1 .....     | 2    |        | 80,00      |
| November 1 .....      | 2    |        | 80,00      |
| 1908—January 1 .....  | 2    |        | 80,00      |
| March 1 .....         | 2    |        | 80,00      |
| May 1 .....           | 2    |        | 80,00      |
| July 1 .....          | 2    |        | 80,00      |
| November 1 .....      | 3    |        | 120,00     |
| 1909—February 1 ..... | 3    |        | 120,00     |
| May 1 .....           | 3    |        | 120,00     |
| Total .....           | 25   | 1      | \$1,040,00 |

The Kerr Lake dividend for the third quarter of 1909 announced at 30c per share, brings the total disbursements that mine up to a total of \$1,320,000, or 38 per cent. on a total capitalization authorized and issued of \$3,000,000. The value of the shares is \$5.

# STATISTICS AND RETURNS.

The Dominion Coal Co.'s shipments for July totalled 203,982 tons.

The output of coal from the mines of the Nova Scotia Steel & Coal Company for the month of July totals 74,613 tons, and in addition 24,300 tons lifted from the coal bank. This output is considered very good, especially as the days worked for the month numbered only twenty-five, making the average 3,000 tons daily.

Shipments from the collieries of the Cumberland Railway & Coal Co. for the month of July were 29,295 tons.

Shipments of ore from Cobalt camp for the month of July totalled 2,715 tons, as against 3,323.74 tons in the preceding month. There were 21 shippers, and they sent out 106 cars. In the seven months the camp has shipped 18,006.20 tons, which compares with 25,361.10 tons in the whole of 1908. The monthly totals are:—

|                | Tons.           |
|----------------|-----------------|
| January .....  | 2,374.03        |
| February ..... | 2,113.94        |
| March .....    | 2,447.90        |
| April .....    | 2,482.83        |
| May .....      | 2,508.71        |
| June .....     | 3,323.74        |
| July .....     | 2,715.05        |
|                | <hr/> 18,006.20 |

Consolidated Mining & Smelting Co. of Canada, Ltd., reports more receipts at the Trail smelter, in tons, for the week ending July 31st, and year to date, as follows:—

|                            |             |               |
|----------------------------|-------------|---------------|
| Centre Star .....          | 3,349       | 99,091        |
| St. Eugene (Concen.) ..... | 453         | 13,971        |
| Snowshoe .....             | 4,083       | 70,706        |
| Other mines .....          | 1,599       | 25,411        |
| Total .....                | <hr/> 9,484 | <hr/> 209,179 |

## COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending July 21, and those from Jan. 1, 1909, to date:—

|                        | July 31.    | Since Jan. 1. |
|------------------------|-------------|---------------|
|                        | Ore in lbs. | Ore in lbs.   |
| Chambers-Ferland ..... | 60,430      | 900,070       |
| Cobalt Central .....   | 40,180      | 477,804       |
| Coniagas .....         | 62,520      | 051,525       |
| Crown Reserve .....    | 63,000      | 3,506,379     |
| Kerr Lake .....        | 60,700      | 1,298,146     |
| La Rose .....          | 260,000     | 7,458,023     |
| McKinley-Daragh .....  | 57,300      | 1,115,206     |
| Nipissing .....        | 187,280     | 7,936,393     |
| O'Brien .....          | 64,030      | 1,482,542     |
| Right of Way .....     | 123,330     | 2,032,691     |
| Silver Cliff .....     | 60,820      | 60,820        |

The shipments to July 31, 1909, from Jan. 1, are 34,837,962 pounds, or 17,418 tons.

Total shipments for week ending July 31 are 1,039,590 pounds, or 519 tons.

## COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending Aug. 7, and those from Jan. 1, 1909, to date:—

|                               | Aug. 7      | Since Jan. 1. |

| Rambler-Cariboo ..... | 22    | 475     |
| Other mines .....     |       | 13,060  |
| Total .....           | 3,738 | 108,905 |

The total shipments for the past week were 30,941 tons, and for the year to date 1,026,086 tons.

#### SMELTER RECEIPTS.

|                                  |        |         |
|----------------------------------|--------|---------|
| Granby, Grand Forks .....        | 18,763 | 570,767 |
| Consolidated, Trail .....        | 9,484  | 219,680 |
| Le Roi, Northport .....          |        | 12,761  |
| B. C. Copper Co., Greenwood .... |        | 140,505 |
| Totals .....                     | 28,247 | 943,713 |

For the first six months of 1909 Granby Consolidated has produced in round figures 12,000,000 pounds of copper—a recovery of 24 pounds of copper to the ton upon 495,000 tons of ore treated.

In this six months period Granby has earned a profit of about 3 cents per pound upon this product, which would be equal to about \$2.75 per share.

Granby will place in commission two more of its enlarged furnaces. In a few weeks the entire battery will have been enlarged, and then the Granby will be able to produce 35,000,000 pounds of copper per annum at a 10-cent average cost. Such output and cost would indicate net earnings of \$8 per share on 13-cent copper and \$2.50 per share additional earnings for every 1-cent advance in copper.

#### RHODESIAN GOLD OUTPUT.

The total output of gold from Rhodesia for the month of June is cabled as 51,678 ozs., valued at £217,600, as against 53,467 ozs., valued at £225,032, in the previous month. This is a decrease on the month of £7,432. There were 229 gold producers last month. The output of other minerals for last month was: Silver, 23,049 ozs.; lead, 83 tons; coal, 16,347 tons; copper, 9 tons; chrome ore, 4,207 tons; asbestos, 20 tons.

The following table shows the monthly gold returns in sterling, for six months of 1909:—

|                |           |
|----------------|-----------|
| January .....  | £204,666  |
| February ..... | 192,497   |
| March .....    | 202,157   |
| April .....    | 222,700   |
| May .....      | 225,032   |
| June .....     | 217,600   |
| Total .....    | 1,264,652 |

#### TORONTO MARKETS.

##### Metals.

Aug. 9.—(Quotations from Canada Metal Co., Toronto.)  
Spelter, 5¼ to 5½ cents per lb. (Market strong).

Lead, 3.4 to 3.5 cents per lb.

Antimony, 8 to 9 cents per lb.

Tin, 30½ cents per lb.

Copper—

Casting, 13.5 per lb.

Electrolytic, 13.75 cents per lb.

Ingot brass, 9 to 14 cents per lb.

Pig Iron.—Aug. 9.—(Quotations from Drummond, McCa Co.)—

Summerlee, No. 1, \$22 (f.o.b. Toronto).

Summerlee, No. 2, \$21.50 (f.o.b. Toronto).

Midland, No. 1, \$19.50 (f.o.b. Toronto).

Coal—

Anthracite, \$5.50 to \$6.75.

Bituminous, \$3.50 to \$4.50 for 1¼ inch lump.

#### MARKET REPORTS.

##### Coke.

Aug. 5.—Connellsville coke, f.o.b. ovens—

Furnace coke, prompt, \$1.60 to \$1.70 per ton.

Foundry coke, prompt, \$1.85 to \$1.90 per ton.

##### Metals.

Aug. 5.—Tin, straits, 29.40 cents.

Copper, prime lake, 13.50 cents.

Electrolytic copper, 12.90 to 13 cents.

Copper wire, 15 cents.

Lead, 4.30 to 4.35 cents.

Spelter, 5.60 to 5.65 cents.

Sheet zinc, 7.75 cents.

Antimony, Cookson's, 8.25 to 8.37½ cents.

Aluminium, 21 to 24 cents.

Nickel, 40 to 47 cents.

Platinum, \$22.50 to \$23.50 per oz.

Bismuth, \$1.75 per lb.

Quicksilver, \$43 to \$44 per 75 lb. flask.

#### PERSONAL AND GENERAL.

Mr. H. Kilburn Scott has left for Bulgaria on professional business.

Mr. Algernon P. Seymour has been appointed superintendent of the Cobalt Lake Mining Company.

Mr. R. T. Hodgson, M.A., a graduate in the geological department of Queen's University, who has spent the last nine years in the West, has been renewing acquaintances in Toronto. Mr. Hodgson was well known in Eastern Ontario ten or twelve years ago in connection with his work as assistant to W. G. Miller in the corundum field in 1897-8.

## PRINCIPLES OF MINING

By H. C. HOOVER, E. M. 200 pages, 6x9, fully illustrated, \$2.50 (10/6).

### Valuation—Organization—Administration

An important book on underlying principles.

Part I covers fully the determination of value, prospective and in sight—the sizing up of the mine. Part II discusses the development and organization—tunnels, shafts, crosscuts, etc., with chapters on mechanical equipment and efficiency. Part III takes up the problem of administration—later efficiency, unions, wages, working costs, accounts, division of expenditure, etc.

## Mining Methods in Europe

By L. W. MAYER, E. M. 170 pages, 6x9, fully illustrated, \$2.50 (10/6).

Based on Mr. Mayer's report to a large American holding Company on methods employed in Europe. He found a great deal that will make for larger and more economical extraction in American practice.

Points covered: caving system, longwall in England and France, robbing high pillars and various others.

### UNDERGROUND SURVEYING

By LOYAL W. TRUMBULL, E. M.

250 pages, 6x9, illustrated, \$3 00 (12/6.)

The first work based on American Practice. Prepared with the assistance of leading American engineers. Contents cover Instruments, Meridian, Underground Practice, Carrying Meridian Underground, Secondary Openings, Records, Maps, Bore hole Surveys, etc.

## BOOKS ON MINING

All Prices Net and Postpaid

**GUARANTEE:** When cash accompanies an order the purchaser may, within five days of receipt, return any or all of these books and his money will be refunded promptly.

### MINE TIMBERING

By SANDERS, PARLEE, MacDONALD and OTHERS

176 pages 6x9, illustrated, \$2.00 (8/6).

A series of practical papers, covering thoroughly the difficult problems of timbering. Some of the subjects treated are: Stopping, Dry Walling, Square Sets, Roof Supports, Framing, Arch Centers, Cribs, Tools and Machinery.

## Mining, Mineral and Geological Law

By CHARLES H. SHAMEL. Over 600 pages, 6x9, illustrated, \$5.00 (21s.).

Full and complete treatment for mining lawyers and engineers. The underlying principles, common law, definitions and discussions of decisions. Includes full text of U. S. and the State Statutes and the rules governing public lands.

### Economics of Mining

Edited by T. A. RICKARD

421 pages, 6x9, \$2.00 (8/6).

The following sub-titles of the book will indicate its value: Gold Mine Accounts; The Cost of Mining; The Valuation of Mines; Mine Equipment in Relation to Ore Reserves, and a discussion besides of the special classes of mining at various important centers. In each case an expert has been chosen for the work.

### Simple Mine Accounting

By DAVID WALLACE.

64 pages, with bookkeeping forms, \$1.00 (4/6.)

A compact and extremely simple system for small mines. Mr. Wallace is an expert accountant.

### Elements of Mining and Quarrying

By SIR C. LeNEVE FOSTER

5x7½, cloth, \$2.50.

A Treatise for Beginners

General contents: Occurrence, Discovery, Boring, Excavations, Explosives, Support, Timbering, Exploitation, Haulage, Hoisting or Winding, Drainage, Ventilation, Lighting, Access, Dressing, Legislation, Condition of the Workmen, Accidents.

### Report Book for Mining Engineers

By A. G. CHARLETON

Pocket size, new edition, \$2.50

Instructions and forms for mining engineers. Full of useful data.

**Book Dept. Canadian Mining Journal**  
**Confederation Life Bldg., Toronto**

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

**CANADA.—DEPARTMENT OF MINES.****Geological Survey****PUBLICATIONS**

The Geological Survey has published maps and reports dealing with a large part of Canada and with many local areas and special subjects

**MARITIME PROVINCES**

The whole of Cape Breton and a large portion of the coal and gold fields of Nova Scotia have been reported upon and mapped on a scale of 1 mile to 1 inch. The remaining portions of the province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter provinces, mapped on a scale of 4 miles to 1 inch.

**QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the province north of the St. Lawrence are also available.

**ONTARIO**

A large part of the province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

**THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the provinces of Manitoba, Saskatchewan and Alberta.

**BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the province, have been reported upon and mapped.

**YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

**THE NORTH-WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to *THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

**THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED :****NOVA SCOTIA**

1019 City of Halifax Sheet.

1025. Waverley Sheet.

The above two sheets belong to the regular series of Nova Scotia map sheets on a scale of one mile to one inch. The first includes Halifax City and Harbour, the second the Waverley Gold District.

**ONTARIO**

1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

**BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shews the geology and location of veins.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch, by W. H. Boyd.

NOTE.—Maps recently published may be had on linen cloth for use in the field at the price of 10c. per copy.

**REPORTS**

1072. Summary Report of the Operations of the Geological Survey for year 1908.

The Geological Survey, under certain limitations, will give information and advice upon subjects relating to general and economic geology. Mineral specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to *THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

*When answering Advertisements please mention THE CANADIAN MINING JOURNAL.*

# Ontario's Mining Lands

---

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries  
Quebec.**

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,035 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
 Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

**General Passenger Department, Intercolonial Railway**  
**MONCTON, N.B.**

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and  
Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other  
Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

for its excellent equipment. All are pleased with the bright, modern coaches; the exceptionally roomy berths in the sleeping cars; superior dining car service, etc.

The "good cars" bring the C. P.R. hundreds of passengers every week.

All equipment is built in the Angus Shops at Montreal from the most modern designs, embodying every improvement known to practical railroading.

R. L. THOMPSON, District Passenger Agent, - - Toronto

# Behrend Concentration System

## Combination WET and DRY

A complete recovery from all slimes and minerals such as Graphite, Galena, Stibnite, Chalcopyrite, Tetrahedrite, Sylvanite, Molybdenite, Stephanite, Argentite, Ruby Silver and Native Silver.

This system will make low grade deposits pay. Every mine having an eye to business should investigate this system which has the approval of leading mining authorities.

A completely equipped plant, including concentrators, crushers, rolls, etc., for testing purposes is located at address below. Forward a sample of your ore for preliminary test.

## Behrend Concentrators, Limited

48 Inspector Street, Montreal

## Underwood

At every Underwood office there is a Stenographers' Department for the convenience of business men. Stenographers are carefully tested and graded. You get the right one for the place.

Last month in Toronto alone we received over 400 applications for Stenographers, and filled over 350 positions—3,000 a year.

The service which goes with the Underwood costs you nothing, but you can't get it with any other typewriter at any price.

**Amatite**  
B  
**ROOFING**

**No more paint for me!  
I've now covered every roof  
on my place with Amatite.**

**T**O buy a roofing that requires painting is inviting trouble. Painted roofings are as out of date as the harvester machinery of thirty years ago.

The roofing of to-day needs no painting. That's one of its great features.

If you are still using the "old rubber kind," the kind that requires painting every year or two to keep it tight, we want to tell you about Amatite; why it *needs no painting*; why it *wears longer* than the "smooth surfaced" roofings, and why it *costs less*.

*First*—Its chief ingredient is Coal Tar Pitch—not a "secret compound" but a well known, long tested material, recognized by engineers as the greatest waterproofing material known. *Two layers* of this material are used in every sheet of Amatite.

*Second*—We use two layers of the best grade of wool felt to hold the pitch in place. This wool felt gives tensile strength to the roofing, and is the best material known for that purpose.

*Third*—On top of these four layers is a *real mineral surface*. This surface requires absolutely no painting, and adds materially to the life of the roofing. It is fire retardant. It is permanent.

**FREE SAMPLE**

We want to send you a sample so that you can see what a solid, substantial waterproof roofing Amatite really is. Write to-day. Address nearest office.

# ELECTRIC HOISTS

**On Hand**

Owing to the failure of one of our customers due to the financial depression, we have on hand two Electric Hoists as follows:

1 double drum electric slope hoist having drums 60 inches diameter by 38 inches face arranged tandem. Capacity 8000 lbs. at speed of 350 feet per minute on a 35° slope, equipped with 75 H.P. type F. alternating current motor, 440 volts, mounted on same frame and having the necessary controller and resistances, dial Level indicator for each drum.

1 double drum electric hoist for vertical shaft, drums 60 inches diameter by 38 inches face arranged parallel. Capacity 4000 lbs. at speed of 450 feet per minute, skips being operated in balance equipped with 60 H.P. type F. alternating current motor 440 volts, mounted on same frame and having the necessary controller and resistances, dial Level indicator geared for 500 feet.

They are high class machines in every respect and will be sold at a low figure.

### ONTARIO'S NEW SCHOOL BOOKS.

Time was, and is yet, when the purchase of school books constituted a serious annual drain on the resources of the wage-earner. The old "readers," "spellers," "jographies" ("geography" is a modern corruption), "rithmetics," "grammars," and so on, were costly. Indeed the prices charged for them were squares or cubes of their intrinsic value. Often these stilted volumes would descend progressively through each member of the family. Hence, by the time they got into the hands of the youngest of a large brood the school books were in a shocking state of disrepair.

If our memory does not mislead us, it is within bounds to assert that the only enjoyment extracted from the "readers" of a generation ago arose from their use as missiles and from an interchange of transfer-pictures and other amenities on the fly-leaves. Our instructors probably would have developed a brain-storm had their pupils shown symptoms of deriving pleasure from their allotted stint. In short, the function of the teacher was to crowd into the child's mind as many facts and figures as possible—very much as the farmer packs hay into the mow. And, at stated intervals, under the artificial pressure of oral and written examinations, the pupil was supposed to exude these facts and figures. Ability was judged by the facility with which youthful victims could string off the names of countries, monarchs, and political divisions, or jabber the meaningless "dates" of irrelevant events in history. It is not surprising then that many luminaries in the firmament of letters, such as Sir Walter Scott and Robert Louis Stevenson (and others whom we refrain from mentioning) should have been branded as unsuccessful students. It merely meant that boys possessed of any degree of originality were instinctively averse to surrendering their intellectual independence, and were unable to find in the school-room anything to inspire either their interest or their respect.

But the old order has changed. The eyes of pedagogues have been opened. Continued study and observation of the psychology of the child, and closer attention to the laws of hygiene, have wrought marvels in our educational system; although no one can truthfully affirm that many and manifest defects do not yet exist. Morally, mentally, and physically, the conditions of school children to-day is vastly better than it ever has been. And, perhaps, the most striking outward and visible manifestation of this growth in grace is in the modern school book. This brings us to the subject on hand.

The Ontario Department of Education has recently issued a series of school "readers." These books are

durably bound, beautifully printed, and decently illustrated. In price they range from four cents for the "primer" to sixteen cents for the "fourth reader." These prices are little less than marvellous. The enterprising firm that took such a low contract may be credited with some species of legerdemain, and the Department is certainly to be felicitated upon the price and appearance of the new readers.

But as regards the matter contained in the books, there is room for much difference of opinion.

While we believe that in general the compilers are on the right track, we think that they have fallen short in one essential. On the frontispiece of each reader is a coloured reproduction of the British flag. Throughout the reading matter there is an ample sprinkling of incidents and exportation calculated to inspire sentimental loyalty. But there is a marked paucity of readings that tell of Canada as it is, of our fisheries, agriculture, mining, and manufactures.

Possibly we have an overplus of sentimental loyalty in this country. Vociferations do not build empires. Flag-waving does not develop our nationhood. What every Canadian needs, what should be one of the first prerequisites of citizenship, is an intelligent knowledge of Canada. This has not been kept in view in compiling the Ontario Readers. In fact, this is the point of our argument. We believe that those who are responsible for the "readers" have given too little attention to things Canadian, and too much to conventional literature.

The half-tones that embellish the text are good. They are distinctly Canadian. But there is nothing to correspond to them in the text. Some, at least, of the material purporting to deal with our great Northwest is fearfully inaccurate. Many sources, from which profitable material could have been obtained, have been overlooked or neglected. The compilers need to be reminded that in our progress towards nationhood the building of a railway is of infinitely greater significance than any political or military episode. And surely our children should be taught the meaning of our railways, our mines, our forests, and our farms.

Glancing through the two more advanced "readers," we can see nothing that would indicate to a child that Canada possesses minerals and mines. This is an inexcusable omission. The neglect of one industry might be excused, but when practically no mention is made of industrial phases of life, then we claim that the point-of-view is radically wrong.

Briefly, the new Ontario Readers, excellent though they be in many regards, still conform to the outworn and artificial standards of thirty years ago. While they are probably the best school books that we have yet seen, still they fall very far short of what they should and could be.

## QUARTERLY DIVIDENDS.

The first few years in the life of a metalliferous mine or of a colliery are normally apt to be non-productive of net profits. The bonanza mine may be able to render dividends in its first year. But, even when this is possible, it is seldom good business. The exigencies and risks of mining demand that positive reserves of ore and cash be developed before dividends are thought of.

It is often the case that a mining concern, flushed with early success, commits itself definitely to the policy of paying quarterly dividends. Almost always such a course necessitates the occasional or frequent passing of dividends. Cobalt has provided several disturbing instances of this.

Other things being equal, it appears to us that annual declaration of dividends is certainly preferable to quarterly distributions. Temporary setbacks frequently disturb the operation of a mine to an extent that renders extraordinary expenditure necessary, or curtails for a period the output of ore. These passing difficulties may be felt keenly for a month or longer, but may be entirely overcome during the year. Hence, when quarterly dividends would seriously inconvenience the management, yearly dividends would not affect operations. We prefaced the last paragraph with the conditional phrase. Other things are not equal. The quarterly dividend is looked upon as a spur to the mine manager. The shareholder becomes accustomed to claiming it as his right, and the mine suffers. Moreover a dividend expected every three months provides an effective instrument for the stock manipulator.

We shall be glad to receive and publish expressions of opinion from our readers. The subject is important from more than one point of view.

## ORGANIZED LABOUR.

The constantly increasing efforts of labour leaders in the direction of international confederation are pregnant with significance. It requires no flight of the imagination to discern a settled design beneath the visit of prominent American labour-socialists to Europe. It is quite as improbable that the incursion of the United Mine Workers into Canada arose from the unselfish desire of certain demagogues to aid the miners of the Dominion. Whatever the ostensible objective of the labour propaganda may be, its ultimate purpose is the widest and closest possible inter-union of labour societies.

And in this aim, per se, there is little to condemn. Individuals and societies alike, who strive to ameliorate the conditions of human life, are deserving of praise and sympathy. But it is a patent fact that the majority of labour leaders on this continent are demagogues, imbued with the dogmata of a crude form of socialism which is in reality a variant of anarchism modified by

opportunism and illiteracy. To demagoguery, for instance, and to demagoguery alone, is to be attributed last weeks episode in a coal mining district in the United States. Here a strike was imminent because of the proposed introduction of safety explosives. The incredible folly of the miners in opposing a measure calculated solely to reduce the risks under which their daily work is performed, is due, of course, to ignorant prejudice. But their leaders, often profoundly ignorant themselves, foster and encourage the ignorance, prejudice, and passions of their followers. Anyone who will take the trouble to read the official utterances of labour periodicals—and the U. M. W. A. Journal is an outstanding example—cannot but admit the justice of this indictment.

As a general proposition, it is true that the leaders of mining labour are antagonistic to the introduction of regulations, devices, and methods that are calculated to prevent loss of life. This is especially true of coal mining.

In Great Britain a temporizing government has pondered consistently to the most radical section of labour-socialists. Whilst the militarism of Germany can hold revolutionary tendencies in check, in Great Britain no such corrective is either possible or desirable. Great Britain, and all Anglo-Saxon countries, must depend primarily upon the controlling influence of educated public opinion.

Now, since mining labour is highly organized, there is present an essential need that operators and owners organize. But this organization must not be called into being as a corporate entity hostile to labour bodies. On such a foundation success would not be worth attaining. The basic problem is not one of warfare, but of co-operation—co-operation, national and international, as between mine owners first, and then as between owners and labour.

The first step in this desired consummation must be local and national union of mine owners or operators. Never was the need so apparent as it is to-day in Canada. Indeed, the value of mining investments depends more to-day upon labour conditions than ever before; and no other factor is so uncertain. Hence, if only as a business precaution, it is incumbent upon mine owners to get together and stay together. Only by mutual trust and concerted action can mine owners hope to guard their interests adequately. And only by temperate methods, wise forbearance, and the dissemination of right knowledge can the confidence of organized labour be won.

Meanwhile it is pertinent to observe that Canadian mine owners will never have as fair an opportunity of organizing as is offered them by present conditions.

## EDITORIAL NOTES.

The latest news from Gow Ganda is encouraging. Four new substantial discoveries are announced, one of which is that of a silver vein encountered at a depth of one hundred feet.

It is rumoured unofficially that the royalties exacted by the Ontario Government from certain Cobalt mines are to be reduced considerably. This is unquestionably a move in the right direction. Apart from all consideration of business ethics, it is and has been a doubtful method of raising income for the province.

The cost of mining coal in Great Britain is fast reaching a point when the profit to the operator will disappear. When that time shall have arrived, it appears probable that power will be generated at the pit-mouth and distributed over Great Britain from enormous central stations. Some such change must take place within a comparatively short time.

The Elmore vacuum-flotation process is based primarily upon the selective action of oil for metallic mineral particles in a flowing pulp of crushed ore and water. The addition of acid materially increases this action. The air or gases dissolved in water are partly or wholly liberated upon lessening the pressure below that of the surrounding atmosphere. Gases, also, may be generated in the pulp, or by introduction from an external source. The bubbles of gas attach themselves to the oiled mineral particles and cause them to float to the surface of the liquid. The quantity of oil and acid necessary ranges from 3 to 10 lb. per ton of ore treated. A large variety of cheap oils and residuums have proved suitable.

About 70 machines are now in use or under construction. An extraction of 98.8 per cent. is recorded on a 3.48 per cent. copper ore in which barytes formed the gangue. For a 3.40 per cent. molybdenite ore, feldspar gangue, on extraction of 93.2 per cent. was obtained. Gold, silver, lead, antimony, zinc, graphite, ores and tailings have been successfully treated. In one copper mine where three units are installed, the working costs are about 75 cents per ton of ore treated. At another mine, one unit handles from 120 tons to 200 tons per week. The ore in this instance carries 0.75 per cent. copper and is concentrated to 16 per cent., leaving 0.14 per cent. in the tailings. The approximate working cost (not including general management) is 24 cents per ton. Other much lower costs are recorded.

# MODERN PRACTICE OF ORE-SAMPLING.

Advance Copy of Paper to be Read Before the American Institute of Mining Engineers, Spokane Meeting, September, 1909.

By David W. Brunton, Denver, Col.

From the old-fashioned "grab-sample" to the modern timing-device, which takes a machine-sample with mathematical precision, there is a wide gap which was only crossed by many years of toil and unremitting endeavor. Even to-day, notwithstanding the advancement in the art, "grab-sampling" is still practised—some times to afford the unscrupulous mine-promoter a basis for fairy-tales with which to entrap the too-gullible investor, and often by milling and smelting companies to determine the amount of moisture in custom ores. The latter practice is almost as reprehensible as the former, and it causes more trouble and ill-feeling between seller and buyer than all other factors put together. No reputable concern to-day would think of attempting to determine by grab-sampling the amount of gold, silver lead, or copper contained in an ore, and yet many buyers expect the miner to accept the results of grab-sampling in the determination of the amount of water contained in the ore, forgetting that accurate results are just as necessary here as in the determination of the metals, because the result determines the percent-

FIG. 1.—SAMPLE BISECTED BY A SHEET OF GLASS, SHOWING PROPORTION OF COARSE AND FINES.

age of weight of the ore which shall be excluded and considered to have no value whatever.

Samples for the determination of moisture should be taken with as great care as samples for the determination of metallic content, and in order to avoid the extra expense of a separate operation moisture-samples should be taken from the sample-safe. As the sample reaches the sample-bin in a smaller stream and by a more circuitous route than the "reject" travels in its path to the outgoing car, it loses more moisture en route, and a constant should be added to compensate for this difference. Carefully conducted experiments have shown that the difference in loss of moisture between the two routes does not exceed 10 per cent. in summer and 7 per cent. in winter. For instance, a lot of ore shipped during the summer months, in which the machine sample showed 5 per cent. of moisture, would have an actual moisture content of 5.5 per cent. Grab-sampling by an interested party, at its best, is only a prejudiced conjecture, while at its worst it gives rise to the most unscrupulous practices with which the ore producer and the mining investor have to deal.

Shovel sampling, another archaic method which is still used in some localities, consists in throwing out from the car or wagon every third, fifth, or tenth shovelful for a sample. As the portion of the pile from which the

FIG. 2.—SAMPLES SPREAD OUT INTO A PANCAKE.

sample is taken is entirely at the discretion of the operator, the process would be more properly named fifth-shovel selection than fifth-shovel sampling. Between the conscientious workman who endeavours to be absolutely upright, and often becomes, as the Scotchman said, "maer than plumb," and the scheming labourer who, desiring to make his "job solid," takes a "safe sample," there is little room for truth or accuracy in this method, and the sooner it is consigned to oblivion the better for every one concerned.

Thirty years ago Cornish quartering was the almost universal method of sampling in use, and it is still employed to a considerable extent in cutting down machine samples and in mine examinations where no machinery can be had. When properly carried on with skill, care, and common honesty, fairly good results may be obtained by quartering, but between the possibility of accidental

FIG. 3.—SAMPLE CONED AROUND A ROD.

mistakes and the opportunities which it affords for skillful and unscrupulous operators to manipulate the sample, it has fallen almost into disuse, and should have been completely abandoned long ago. The inherent

defect of this system lies in the fact that piling a lot of ore in the form of a cone does not mix it, as the advocates of this system claim. Dropping shovelful after shovelful of ore on top of a cone, instead of building up a homogeneous pile, actually produces a very perceptible sorting action, whereby the fines build up where they fall on the center of the cone and the coarser particles roll outward and down the sides. This is illustrated in

FIG. 4.—SAMPLE CONE WITH DRAWN CENTER.

Fig. 1, which is a half-tone from a photograph of a cone built up in actual sampling practice and bisected by a sheet of glass. This section shows conclusively the great difference in the relative proportion of coarse and fines between the outer and inner portions of the cone, and also makes it perfectly clear that even after the cone has been spread out into a pancake, as shown in Fig. 2, the fines in the lower portion of the cone will be entirely undisturbed. The most uniform and best results are obtained by cining around a rod, as shown in Fig. 3. By this means the center of the cone is maintained in a vertical line, and if care is taken in working down the cone to a "pancake," as shown in Fig. 2, and separating the quarters by steel blades, so that there is no difference between the quadrants taken for the sample and those thrown into the reject, the results give a fair approximation of the truth, though it is not possible to duplicate results very closely by this method, even at its best.

It would take altogether too much space here to enumerate the different schemes which unprincipled

FIG. 5.—SAMPLE WITH DRAWN CENTER SPREAD OUT.

operators have introduced into this method for the purpose of "throwing" the sample, and description of one of them will suffice.

The most ingenious of these plans, and one which is so difficult to detect that it can be carried on directly

under the eyes of a skilled observer without detection, is what is known as "drawing the center." The cone is started on the floor, as shown in Fig. 3, but without any rod to determine the position of the center. The operator in charge of the work, in dropping his shovelfuls of ore on the top of the cone, does it in such a manner as to draw the center of the cone imperceptibly in a certain direction, so that by the time the entire sample is piled and ready for spreading, the apex of the cone, shown in Fig. 4, is several inches, we will say, to the SE. of the original center, which is indicated by the perpendicular line, A. The ore may now be spread as usual with shovels or with a board, and cut and marked into quadrants by steel blades in alignment with the four points of the compass, as shown in Fig. 5, where the rod, A, indicates the original center of the cone, which, of course, has been entirely undisturbed by the mixing and spreading of the upper portion. By rejecting the NW. and SE. quarters an excess ratio of the fines is eliminated, and since these are generally the richest ore the metallic contents of the two retained quadrants, shown in Fig. 5, will be somewhat less than the average of the original pile. Suppose a 2,000-lb. lot is to be reduced to 62.5 lb., it would mean that the "quartering" (really halving) would have to be repeated five times, and if at each stage the sample taken represented 98 per cent. of the actual value of the cone, the final sample would only give 90.3

FIG. 6.—U-SHOVEL SAMPLING.

per cent. of the true value of the cone, as shown in the following tabulation:

|                           | Original Lot. | First Cut. | Second Cut. | Third Cut. | Fourth Cut. | Fifth Cut. |
|---------------------------|---------------|------------|-------------|------------|-------------|------------|
| Weight, lb.,              | 2,000         | 1,000      | 500         | 250        | 125         | 62.5       |
| Percentage of true value, | 100           | 98         | 96          | 94.1       | 92.2        | 90.3       |

The shifting of the cone-center is easily carried out; in fact, it is difficult to avoid it unless some definite means of preventing it is adopted. Fig. 1 shows very clearly the structure of a cone with a "drawn" center, and in this instance the effect was entirely unintentional.

The irregularities in the results obtained by Cornish sampling, together with the cost of operation and the amount of room required, soon brought about what is known as "split-shovel" sampling, in which the ore is thrown from a broad shovel, handled by one operator, upon a narrow "U"-shaped shovel, held by another workman, usually directly over a car or wheelbarrow, as shown in Fig. 6. This method, while it requires two men to do what normally appeared to be the work of one, was cheaper than Cornish quartering, but it proved no great improvement over the latter in point of accuracy, since carelessness in almost any direction interferes seriously with the results.

The earliest attempts at mechanical sampling were made by subdividing a falling stream of ore; a process based on the supposition that an ore-stream could be mixed so as to be perfectly homogeneous. Both analysis and experience have shown that this ideal condition is impossible, and mechanical devices for taking a portion of the ore-stream all of the time have been almost entirely displaced by machines designed to take all of the ore-stream for a portion of the time. It is not practicable to produce a stream of ore which shall be continuous in value through every part of its length any more than

FIG. 7.—SHAPES OF SAMPLE-SECTIONS TAKEN BY THE CHARLES SNYDER, BRUNTON, AND VEZIN SAMPLERS.

it is possible to produce a stream of ore that is constant in value throughout its width; but by taking a small sample entirely across a falling stream at very short intervals it is found that, while no single cut would give an exact representation of the composition of the entire lot, the average of thousands of these small samples is so nearly correct that results can be duplicated within very narrow margins, or, in other words, that individual errors are balanced. This was not the case with the devices used for taking a portion of the stream all the time, since the errors due to feed, inclination of spouts, or wear on the bottoms of the spouts are constant, and do not vary during the time the samples are being taken.

Almost coincidental with the discovery of the fact that accurate samples could be obtained by taking all of the stream for a portion of the time, came a very considerable improvement in rock-crushing machinery, so that the modern engineer has a much better opportunity to construct a satisfactory plant than the builder had 20 or 30 years ago. Not only are the rock-breaker and rolls of to-day greatly improved in design, but the manufacturers have availed themselves of modern cheap steel to give all parts an excess of strength over any possible strain, while the use of alloy-steels for the wearing surfaces permits the machines to be kept in much better repair, and requires fewer stoppages for renewals. For sampling-work, crushers and rolls can now be had which are almost as well made as the ordinary steam engine, and so designed as to give complete accessibility for renewals and for cleaning.

Gyratory breakers of the Gates type have the advan-

FIG. 8.—DELIVERY-SPOUT OF CHARLES SNYDER SAMPLER. CUTTING-EDGES RADIAL.

FIG. 9.—DELIVERY-SPOUT OF VEZIN SAMPLER. CUTTING-EDGES RADIAL.

FIG. 10.—CUTTING-EDGES NOT RADIAL.

tage of delivering a very uniform product, and in crushing ores that are hard and dry this type forms by all odds the best initial crushing machine; but with ores that carry wet clay, slate or other substances which will "pack," it is necessary to use a swinging-jaw crusher, preferably of the Blake type. Rock-breakers may be set to crush to any desired fineness, but it has been found that too great a reduction in the size of the product very materially reduces the capacity. In large crushers it is not usually advantageous to attempt to crush below 2 inches in size.

First-class rolls are now always belt-driven, which eliminates the noise and danger attending the operation of the old-fashioned trains of gears. The best practice in roll-crushing is to crush not smaller than half the diameter of the particles fed to any given machine. This rule gives approximately the maximum crushing capacity with the minimum production of fines and the lowest expenditure for power and metal. Rolls require a steady feed, and one which is uniform across the entire width of the shell; consequently, nearly all modern rolls are

equipped with some feeding device. In sampling mills the shaking-tray is generally used on account of the ease with which such feeders can be cleaned after each lot of ore has been run.

For fine-grinding machines, the coffee-mill type still successfully holds its own against most of the newer devices, although the modern sample-grinder is much heavier, better built, and more easily cleaned than its predecessors.

The first mechanical samplers were imitations of Cornish quartering, the "whistle-pipe" being the most common type. With ore finely crushed, fairly dry, well-mixed, and entirely free from strings and rags, and with the dividers new and exactly centering the pipe, fairly good results could be obtained by this method; but as these conditions never existed in practice, and as the edges of the cutters wore rapidly, thereby moving the dividing-line back from the center, this form of sampling-machine was soon discarded, and I believe has now fallen into absolute disuse.

Following the whistle-pipe sampler came the various forms of mechanical split-shovels; but as there was no place in a spout, no matter how wide or carefully built, where a single "U"-shaped spout could be placed to take a sample which would represent the entire width of the stream, this form also was soon discarded.

More recently this splitter has been revived by an adaptation of the ordinary hand-operated splitter (see Fig. 12), in which numerous small spouts are so arranged across the entire width of a larger one that the main ore-stream is divided into a great number of smaller ones, the even numbers being deflected to the right and the odd numbers to the left. This plan works very well on the first division, but as it effects a reduction of only 50 per cent. in the volume, the operation must be carried further, and the streamlets forming the sample centered into a broad stream, which, in turn, passes over another set of splitters, the operation being repeated as often as necessary to reduce the sample to the desired size. It has been found, however, that the mixture of the streamlets after their union is far from perfect, and that there is a considerable difference in the amounts of coarse and fines taken by the sample side of the second cutter, depending on its position relative to the cutter above. If the sample-compartments in the second cutter are directly below the sample-compartments in the overlying splitter, they receive the centers of the streamlets, while the "spread" passes into the reject, and the sample at each step in the bank of cutters receives an amount of fines slightly in excess of the average, thereby seriously affecting the value of the sample, provided there is, as is usually the case, a difference between the metallic contents of the coarse and the fines. Conversely, when each cutter in the bank is placed so as to take the "spread" from the cutter above it, the sample will have less than its due proportion of fines. This disadvantage could be obviated by placing a shaking-tray between each set of dividers, or perhaps even better by moving one divider horizontally across the other, so that each set of cutters would take all parts of the streams from the cutters above them. This arrangement, however, would require considerable head-room, and give a machine which would make a large amount of dust—a feature which is always objectionable in a sample-room.

The latest types of samplers are designed to overcome the difficulties just described, and are usually known as "time-sampling machines," from the fact that they deflect the entire stream into the sample-compartment

for a varying portion of the time, depending on the percentage of sample required. Treating the falling stream of ore as a ribbon, they cut sample-sections directly across its entire width, these portions varying in shape and size with the mechanism employed. Of the many types that have been invented and patented, only three have come into general use, and Fig. 7 shows the shapes of the sample-sections taken by these three machines.

A represents a sample cut from the falling stream of ore by the Charles Snyder 20 per cent. sampler, with four radial intake-spouts, making 7.5 rev. (or 30 samples) per minute; delivery-spout 5 by 25 inches. (This sampler is not to be confounded with the Snyder sampler.) It will be seen, on this machine, that an attempt has been made to combine the old-fashioned continuous sample with the time-sampling system by arranging the delivery pipe and intake-spouts so that as one intake-

FIG. 11.—VEZIN SAMPLER, SHOWING HORIZONTAL CUTTING-EDGES

spout passes out of the stream another enters it on the opposite side.

B represents a Charles Snyder 20 per cent. sampler, with two radial intake-spouts, taking 15 samples per minute; delivery spout 5 by 25 inches. This machine does not take a continuous sample, but has the advantage that the intake-spouts, for a given percentage of sample, have double the width, and are therefore much less liable to throttle or choke; at the same time there is no reason why the sample should not be as accurate as that taken with the other type of Charles Snyder sampler.

C represents the sample taken by the Brunton 20 per cent. sampler, taking 54 samples per minute; delivery-spout 5.75 by 5.75 inches, cutting edges parallel.

D represents the sample from a Vezin 20 per cent. sampler with two radial intake-spouts, taking 30 samples per minute; delivery-spout 6 by 6 inches.

E shows the sample taken by a modified form of sector sampler, which, often through accident and sometimes by design, has come into too general use.

Both the Charles Snyder and the Vezin samplers have sector intake-spouts revolving on a vertical axis,

the only difference between the machines being that the delivery spout in the Snyder sampler is an annular quadrant, *D*, in Fig. 8, while the Vezin delivery pipe is either square or rectangular, *E*, in Fig. 9. In order to take a correct sample the cutting edges of the sector intake-spouts on both of these machines must be exactly radial, as shown in Figs. 8 and 9, otherwise they will include more degrees of arc at one part than at another; and consequently the percentage of sample taken from all parts of the delivery pipe will not be the same, as is shown by Fig. 10, in which the cutting edges are not radial to the center of rotation. This, while by no means an exaggerated example of this form of distortion, shows a 74/360, or 20.8 per cent., sample taken on one side of the ore-stream and 88/360, or 24.4 per cent., on the other. If the falling stream of ore were perfectly homogeneous this arrangement would not make any difference, but it is well known that the ore-stream is not uniform, especially in an inclined spout, in which the coarse, rapidly moving particles go bounding along on the top, while the finer portions hug the bottom, and on leaving the spout the coarse is projected a considerable distance and

FIG. 12.—TAYLOR & BRUNTON SPLITTER.

the fines drop almost vertically, which gives a sorted falling stream, with coarse on one side and fines on the other. With a tangential feed to a sector intake this sorting machine does not seriously affect the sample if the delivery spout is perfectly level and free from ridges which would deflect the particles across the stream; but with a radial feed used, as shown in Fig. 9, and the intake sample spout edges not radial, as shown in Fig. 10, it will readily be seen that a larger proportion of coarse than of fines is taken into the sample.

Since the cutting edges of this class of samplers, Fig. 11, are necessarily maintained in a horizontal position, they are very liable to become overhung with strings, burnt fuse, and drill rags, which the mill attendants often endeavor to remove by pounding the sides of the spout while the machine is in motion, thereby distorting the form of the intake-spout very considerably from a true sector, and rendering it impossible to obtain a correct sample unless the delivery-stream is perfectly homogeneous, which is never the case. The great length of the radial edges of the sector intake-spout renders them, of course, peculiarly susceptible to be thrown out of alignment, and manufacturers of this class of machines

should do something to shorten up the length of the radial edges, or stiffen them to prevent accidental distortion. At first sight it might be thought that this could be accomplished by reducing the size of the sector, but experience has shown that the width of any spout, deliv-

FIG. 13.—THE BRUNTON TIME-SAMPLER. FRONT VIEW.

ery, or intake should be something more than three times the greatest diameter of the coarsest particle passing through it; otherwise, a bridging effect occurs which affects the flow and often chokes up the spout. It is, therefore, good practice to make the width of the feed and intake-spouts four times the diameter of the coarsest particles passing through them.

The Brunton time-sampler oscillates in a vertical plane through an arc of 120 degrees instead of revolving in a horizontal plane like the sector-intake machines, an arrangement which permits the use of a rectangular intake-spout with cutting-edges so short that accidental distortion is impossible, while the tilting of the cutters at the end of the swing materially assists in dislodging any rags or strings which may have fallen on the cutting-edges. This construction requires less head-room than any other system, which effects a great saving in the cost of mill construction, since it not only reduces the necessary height of the building, but shortens all spouts and conveyors. The design of this machine cannot be very clearly shown in a linear drawing, but may be readily understood from Fig. 13, which is a front view of the sampler, having the housing open for cleaning, and Fig. 14, which is a rear view. The various parts are explained as follows: *A*, receiving hopper from crusher or rolls; *B*, delivery-spout; *C*, sample-intake; *DD*, "reject"

FIG. 14.—THE BRUNTON TIME-SAMPLER. REAR VIEW.

divisions; *E*, housing-spout leading to the sample-bin; *F*, reject-spout leading to the shipping-bins; *G*, oscillator-shaft; *H*, gear-shift; *I*, driving-pulley; *J*, spur-gear; *K*, eccentric gear. Ordinarily the machine is driven by the spur-gear, *J*, in which case a 20 per cent. sample is taken,

but when a 5 per cent. sample is required the gear is slipped along the shaft, disengaging the spur and bringing the eccentric gear, *K*, into play. Another advantage in the use of this machine is that, as the discharge of the ore from the sampler is assisted by centrifugal force instead of being retarded thereby, as is the case with all sector machines, it can be run at a much higher rate of speed, thereby increasing the number of samples per minute. This arrangement insures greater accuracy, since the more samples which can be cut from the falling ribbon without "batting" the ore too vigorously with the sides of the cutters, the better are the chances for obtaining an exact average of the stream. A study of

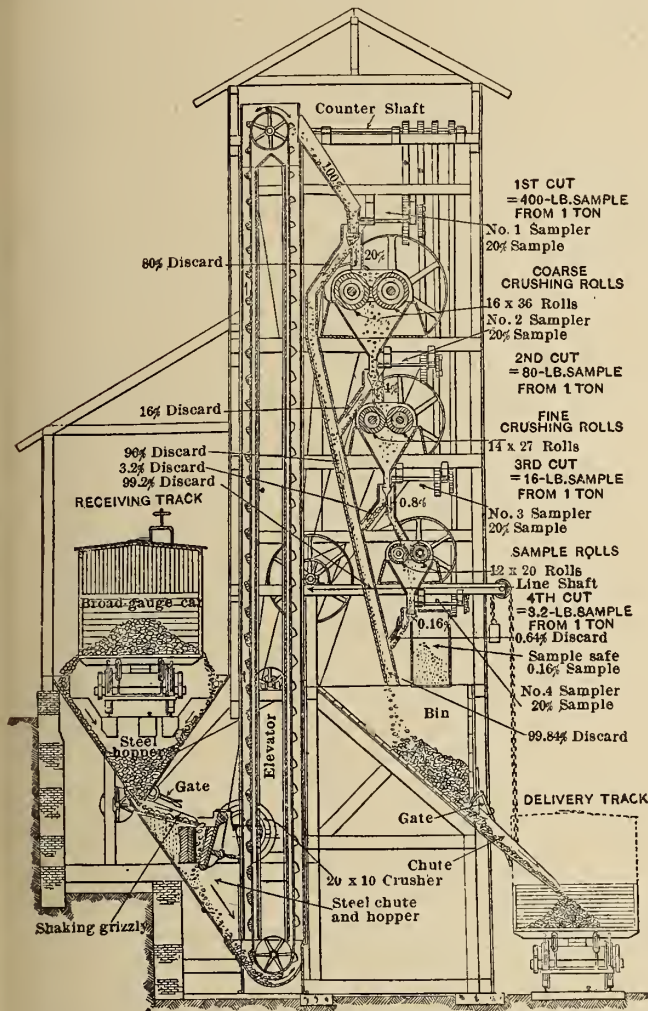

FIG. 15.—TAYLOR & BRUNTON SAMPLING-SYSTEM.

the relations between oscillator, rocker-arm, and disc-crank, Fig. 14, will show how this device takes a comparatively small sample with a large intake-smpout.

While there seems to be a general impression among mining men that high-grade ores are more difficult to sample correctly than those of low grade, there is no reason for this assumption. The difficulty of sampling accurately increases directly as the difference between the value of the highest and the lowest grade material contained in the lot, and is at its maximum when the values are carried in large masses of metallics or crystals of very rich minerals occurring in barren rock.

If we imagine a lot, for instance, of Cripple Creek ore, composed entirely of barren gangue and one solitary piece of calaverite, it would be manifestly impossible to

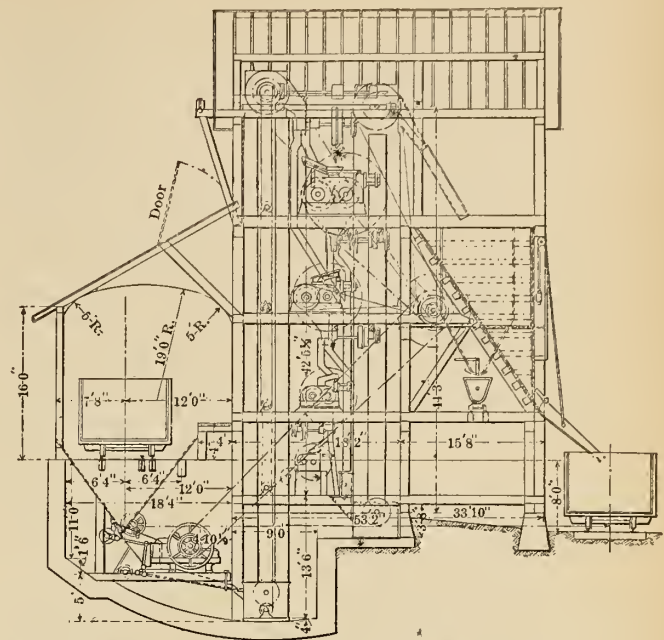

FIG. 16.—VERTICAL SECTION OF THE TAYLOR & BRUNTON SAMPLING-MILL,  
SILVER CITY, UTAH.

sample such a lot of ore without crushing, since in any subdivision either the sample or the reject would contain all of the mineral.

Suppose this lot to be subjected to a slight crushing and the solitary piece of mineral broken into three fragments, then dividing the lot into halves would at the best throw 50 per cent. more value into the one half than into the other; it is therefore clearly manifest that in order to obtain a sample which shall correctly represent this or any other lot, it is necessary to crush it to such a degree of fineness that one particle more or less taken into the

FIG. 21.—FLOW-SHEET, AMERICAN SMELTING &amp; REFINING CO., SAMPLER No. 2, MURRAY, UTAH.

sample shall not materially affect its metallic content. In other words, the maximum error is determined by the ratio of the weight of the largest particle of metal or high-grade mineral to the weight of the entire lot. At this point another condition must be considered. In any lot of ore it is easy to see that the chances of finding a full-sized piece of the highest grade material would be much greater on a lot of ore crushed to 0.25 inch cubes than in a lot crushed in 1-inch cubes, therefore accuracy demands that the ratio between the weight of the largest particle and the entire lot shall increase directly as the fineness.

In this particular, practice and theory are in complete accord, and all of the latest and most improved mills practise alternate crushing and subdivision from the coarsest size down to the finest. It is customary at each successive stage to reduce the diameter of the coarsest particles one-half, thus decreasing the volume to one-eighth, or 12.5 per cent. The usual sample taken at each successive stage is 20 per cent., so that while the size of the particle at each step has been reduced 12.5 per cent., the amount of sample taken is 20 per cent., consequently the ratio between the weight of the largest particle and the weight of the sample rises steadily from the beginning of the series of operations to the end, thereby meeting the conditions theoretically necessary to an accurate determination of value.

An ideal sampling mill, where the situation and nature of the service will permit this form of construction, is shown in Fig. 15. This plant is entirely automatic, and when the ore is received in hopper-bottom cars no manual handling is required at any stage, while the sample is automatically delivered into a locked steel safe. To simplify the drawing, the roll-feeders have been omitted.

Fig. 16 is a vertical longitudinal section of the new Taylor & Brunton mill at Silver City, Utah, completed January, 1909. Like the plant shown in Fig. 15, it is automatic throughout, electric driven, and contains every modern device for facilitating crushing, sampling, and cleaning, the latter operation being performed by compressed air.

A good example of a modern crushing, screening, and sampling plant is shown in Fig. 17 which is a longitudinal section through the new matte and sulphide mill of the Tintic Smelting Co. at Silver City, Utah.

In order to show the methods of operation in vogue in different districts, I present Figs. 18, 19, 20 and 21, which contain the flow-sheets of a number of the newest and largest sampling works, clearly showing every detail of the process, and the machinery employed in the alternate operations of crushing and subdivision, as well as the increase of ratio as the final stages are reached. This style of flow-sheet was originally typewritten on ordinary 8.5 by 13 inch paper, perforated for a loose-leaf binder. In this way flow-sheets of many classes of operations may be preserved in convenient form.

These flow-sheets show considerable differences at all stages, and a great divergency in the methods of subdividing the final sample. Too many manual operations are in use, and there is no doubt that the complete elimination of the personal equation by using a small Taylor & Brunton splitter with  $\frac{3}{8}$ -inch riffles (shown in Fig. 12) gives by far the most accurate subdivision.

To show how closely results between different mills and repeat-sampling in individual mills may be made to check, the following examples, taken at random, should suffice:—

TABLE I.—Sampling-Results, Taylor & Brunton Sampling Co., Cripple Creek, Colo.

| Lot No. | Sample.         | Resample.       |
|---------|-----------------|-----------------|
|         | Gold.           | Gold.           |
|         | Ounces per Ton. | Ounces per Ton. |
| 3192    | 3.62            | 3.64            |
| 3198    | 5.04            | 5.015           |
| 3219    | 2.70            | 2.67            |
| 3235    | 3.18            | 3.16            |
| 3310    | 1.17            | 1.17            |
| 3324    | 6.52            | 6.51            |
| 3340    | 0.71            | 0.78            |
| 3388    | 1.70            | 1.84            |
| 3424    | 9.24            | 9.20            |
| 3471    | 30.64           | 30.52           |

Table VII. gives a comparison on a lot of Bullfrog Pioneer ore sampled at Columbia plant, and afterwards screened through a  $\frac{3}{8}$ -inch screen at Hazen; fines sold to reverberatory and coarse to blast-furnace smelters, actual weights and moistures having been determined both on the fines and the coarse, which makes a showing of a slight loss in weights.

| Coarse.....       | 84,760      | 2.75            | 116.55              |
|                   | 121,669     |                 | 228.38              |

Table VIII. gives a comparison of assays and total ounces of gold contained in four lots of Engineers' Lease ore from the property of the Florence-Goldfield Mining Co., in Goldfield, Nev., sampled at Columbia plant and afterwards screened through  $\frac{3}{8}$ -inch screen at Hazen plant, and the coarse and fines sampled separately after screening.

The dry weights show the same in each case, due to the fact that the fines after screening at Hazen were actually weighed and moistured, thus determining the exact dry weight, which was deducted from the total purchased dry weight, making a figured dry weight of the coarse.

| 692                    | 1.28                     | 1.30'                    |
| 757                    | 1.30                     | 1.25                     |

The most convincing tests of correct valuation in ore-sampling are those in which numbers of small lots are bought and paid for individually, and stored for a considerable time, until a sufficient quantity of ore has been collected to form one large lot. When this period arrives the individual lots are not mixed, but run through the mill in succession, and it is usually found that the mechanical sample of the mixture agrees with the calculated average as determined by the values in the original purchases as closely as the best control-assays.

The small lots when originally received, sampled, and purchased were coarse and generally wet, but when run through the mill the second time they are both fine and dry, giving thereby the greatest possible dissimilarity in conditions of size of particles and moisture-content. The excellent checks obtained on this class of work show conclusively that with "time-sampling" the results obtained are in no way affected by the physical conditions of the ore, and may be implicitly accepted as correct.

The art of sampling has now reached a stage where a standardization of methods is both desirable and possible, and it is to be hoped that the Mining Congress, or the proposed Bureau of Mines, will take the matter under consideration and appoint a thoroughly qualified commission which will give the subject the study and investigation its importance demands. Recommendations by an unbiased, competent board would do much to eliminate faulty methods, and bring about the adoption of standard systems of valuation which would prove of inestimable benefit to the mining and metallurgical industries from both a business and a scientific standpoint.

#### AGALMATOLITE—PSEUDO TALC.

On the south shore of Conception Bay, some ten miles from St. John's city, is a small settlement named Manuels, and three or four miles inland from this a quarry has been opened on a mountain for the working of outcroppings a deposit of substance sometimes referred to as talc. Properly speaking this terminology is incorrect seeing that the deposit referred to is silicate of alumina and potash with little or no magnesia. In fact it more nearly approaches in composition a material known as agalmatolite the figure-stone of the Chinese. The deposits extend over a big area forming the great bulk of two mountains and must contain some millions of tons. The concern operating this deposit is known as the North American Talc Co. They have had an overhead tramway constructed from the mine to the railway, a distance of about two miles. Their pier is at Seat Cove, some ten miles further up the bay, this being the nearest safe harbor for shipping. In 1905 they shipped about two thousand tons to Portland, Me., where the company have a large establishment for grinding the material and converting it into marketable condition.

Samples of the material were shipped to Messrs. Little & Walker analysts, of Boston, who reported as follows: "We find this to consist essentially of a silicate of alumina, containing only 0.05 per cent. iron oxide. This material is unique among those suggested for use as paper fillers in that it closely resembles clay while having the smoothness and other desirable physical properties of talc. We have examined your samples critically with reference to their use as a filler for paper. We consider the colour of the material unusually good, even remarkably good. It is very clean, has a particularly good feel, and is entirely free from mica. In view of these facts and the exceptionally good feel of the material, we feel justified in saying that in our opinion you have produced in the samples submitted to us an exceptionally good filler for the better grades of paper, and one which combines in a unique way the good properties of both talc and clay. The analysis resulted as follows:

|                        |       |
|------------------------|-------|
| Silica .....           | 53.11 |
| Oxide of Alumina ..... | 40.22 |
| Iron .....             | .29   |
| Lime .....             | .69   |
| Magnesia .....         | .90   |
| Loss of ignition ..... | 4.72  |
| Moisture .....         | .07   |
| Alkalis .....          | Trace |

Experiments were also made with the substance as a filler for paper and a summary of the result of the mill test follows. Two lots of paper were made, one loaded with clay and the other with the Newfoundland "talc." The paper with the "talc" gave 22 per cent. ash and retention 77.5 per cent.; that with the clay, 16 per cent. ash and 72 per cent. retention. On the whole the "talc" seemed to work about the same as the clay, the finish with it being, if anything, a little better. The sample lot was also tried for coating and gave satisfactory results, the paper appearing to calender quite easily.

As this material is said to be of great industrial importance in the manufacture of porcelain, china and other wares, as well as possessing many of the desirable qualities of talc, it would appear that when fully developed this area is likely to prove of value.

**A Dictionary of Chemical and Metallurgical Material**, a neat paper-bound pamphlet, has been published by the Electrochemical and Metallurgical Industry, New York. Part I. is a list of machinery, appliances and material used in the chemical and metallurgical industries, with the names and addresses of the manufacturers. Part II. gives an alphabetical list of measuring instruments and laboratory supplies, also manufacturers' addresses in each case. Part III. is a professional directory. The price, 50 cents, is modest. The booklet is well worth having.

The tailings from the St. Eugene concentrator, Moyie, B.C., are being used as ballast by the Canadian Pacific. Four hundred tons per day is the amount of this product accumulating at the mill.

German colliery companies have adopted, almost unanimously, the system of quarterly dividend payments.

# THE MAPLE MOUNTAIN MINING DISTRICT OF ONTARIO.

By J. D. Ramsay.\*

Amid all the excitement and noise of successive booms in Elk Lake, Miller Lake, Gowganda and elsewhere, one district has quietly and persistently, without outside assistance or newspaper advertisement, gone ahead until it has asserted its right to be looked upon as one of the most promising silver mining regions outside of Cobalt. This is the Maple Mountain District, situated in the Township of Whitson, Van Nostrand and Speaight, in the Temagami Forest Reserve, and extending northwards from Anvil Lake for a distance of about nine miles. It is flanked on the west by the high ridge of Maple Mountain, which forms a kind of "Hog's Back" parallel to the diabase outcrop. The district is excellently illustrated in the geological map of the Montreal River district, published by the Mines Department.

It is not altogether easy, in view of the good surface showings from many different properties in the district, to understand why prospectors and others should have overlooked it, and rushed in to much less accessible regions, such as Miller Lake and Gowganda, to say nothing of Shining Tree Lake. A glance at the aforementioned map will show that the southern end of the region can be reached, at Anvil Lake, by no more than five portages, the longest of which is only three-quarters of a mile long, while the rest are "just a jump." However, this summer has witnessed a certain revulsion of feeling among many prospectors and the district is now receiving a little more of the notice which it deserves.

Leaving the River Steamer at Mowat's Landing, a short paddle brings the traveller to Mattawapika Falls, a distant view of which is familiar to those who have been up the Montreal River. Here the first portage, a short one, is encountered; but the tedium of

surrounded mainly by muskeg; and this in its turn gives place to Lady Evelyn Lake at the "Narrows," where the lake contracts for half a mile or so between high bluffs of sandstone and quartzite of Lower Huronian age. On emerging from the narrows, the course leads up the north-west arm of the Lake and round

BOILER ON WHITE RESERVE MINE.

Sucker Gut to the portage to Emily Lake, which is just below Willow Island Falls; this portage is three-quarters of a mile long, and very rough; and the writer hopes that none of his readers may have a similar experience to one, which in company with two companions, he recently fell a martyr to, when he had to make it during a total eclipse of the moon. This is however the only bad portage; and a convenient creek and chain of small lakes lead northwards from Emily Lake to Anvil Lake, on whose western shore the diabase ridge may be said to commence.

Like all the occurrences of this rock in northern Ontario this diabase is a laccolite of fair thickness which appears to have been forced up from below Maple Mountain. The outcrop shows unmistakable escarpment on the east, and a dip slope of about 26° to the west, and runs almost due north and south. From Anvil Lake to Duncan Lake, it forms two high ridges, 200 to 300 feet above the sandy plain lying to the east, and the base of Maple Mountain to the west, these ridges forming a striking feature in the landscape. From conversations with prospectors and others, the writer gathers that this laccolite is probably the same as that found on Lost Bear Lake to the west where it occurs dipping to the east in the direction of Maple Mountain. The latter probably owes its origin to this upheaval.

The diabase presents the usual features; it varies in texture from fine grained diabase to coarse gabbro and in composition from ultra-basic almost to acid-intermediate; in one place on the property of the White Reserve Mines Limited it has all the appearances of syenite.

The veins are markedly parallel, running due east and west across the outcrop, and can in some cases be

packing canoe and kit is amply made up for by the beauty of the falls, and of the succeeding stretch of river above them. Mattawapika River gives place to Mattawapika Lake, a broad and shallow sheet of water

\*Mining Engineer, Traders Bank Building, Toronto.

traced on the surface clear from one side to the other, a distance of a quarter of a mile and upwards. They are of frequent occurrence, and almost invariably show signs of mineral, while from some, high grade ore has been mined and sacked. Alpite veins, so called, are not frequent, but there are many strong leads of smaltite; and in some cases, a kind of impure asbestos is found. Many of the veins take the form of lenses of fine grained diabase enclosed within walls of comparatively coarse grained rock, amounting almost to a gabbro; and on one or other of the faces, lie the smal-

one 80 ounces, the other 90 ounces, per ton. This may be said to be one of the most pleasing features of the district, indicating that a large body of low grade milling ore may be expected.

All the rock is highly mineralized and very magnetic, a compass survey being impossible. Practically every vein shows cobalt bloom, and frequently the mixed bloom of cobalt and nickel; but chalcopyrite is not of such frequent occurrence as in some other parts of the Montreal River district, notably Bloom Lake.

As mentioned previously this region has never had

SHAFT AND POWER HOUSE, WHITE RESERVE MINE.

tite and associated minerals. The walls are so clean, and the natures of the vein rock and country so different in many cases, that it is hard to reconcile this particular mode of occurrence with the now generally accepted theory that the veins in diabase owe their origin to magmatic segregation. Veins having this structure have usually proved the richest in this district, since, in addition to the actual small lead carrying silver, the fine diabase of the lens is often impregnated with leaf silver; and two samples carefully taken which showed no visible metallic silver at all assayed,

a boom; perhaps for that very reason it is better off; for those who have claims in it have been content to do honest work and to prospect the area thoroughly, instead of promoting "Wild Cats" and shaking the confidence of the mining investor yet once more.

The photographs accompanying this article will demonstrate much more clearly than oceans of ink and reams of paper, that mining in this little-heard-of district is being carried on upon legitimate lines, and not with the view of filling the pockets of the company promoter.

## GENESIS AND DEVELOPMENT OF THE COKING OVEN\*

By W. Galloway.

The preparation of coke from pit coal appears to have been practised for at least 250 years. It was probably first begun owing to the increasing difficulty of procuring supplies of timber for making charcoal for metallurgical, malting, and other purposes in which the more easily obtainable and therefore cheaper coke was substituted for the more expensive charcoal. To commence with, and for many years afterwards, in fact far

\*From paper read before the South Wales Institute of Engineers.

into the last century, coke was for the most part made in exactly the same way as charcoal.

Large coal was stacked in circular or oblong piles in the open, partially or wholly covered over with a wet layer of fine coke-dust and with certain channels for the passage of air formed in them just above the level of the ground, and extending from their periphery to one or more vertical chimneys or holes in their centre. The circular piles were from 15 to 20 feet in diameter and 3 to 3½ feet high; the oblong piles 12 to 18 feet wide, 3 to 3½ feet high, and 30 to 50 feet long. The

ends of the air channels next to the periphery were sometimes formed with inverted cast-iron troughs with holes in them; their ends next to the chimneys with the largest blocks of coal, and their intermediate parts with "dry" bricks.

The chimneys had cast-iron lids with handles for closing them air-tight when required. Ignition was effected at the bottom of the chimneys, or vertical holes, by dropping burning coal and pieces of wood down through them; and the fire gradually spread from the centre towards the periphery, or in the opposite direction to the air-currents. Care was taken to keep the mantle of damp coke-dust as air-tight as possible while this was going on, and when smoke ceased to issue from the chimneys or holes all openings were sealed up and the heaps allowed to cool.

Ovens for coking are first mentioned in the latter half of the eighteenth century. In 1773 Horne and in 1782 the Earl of Dundonald obtained patents for the recovery of the by-products obtainable from coal coked in closed vessels or chambers. The Dundonald patent provided for the admission of a restricted and regulated supply of air to the interior of the chamber for the purpose of creating sufficient heat to carry on the process of distillation by the partial combustion of the gases. From that time forward, ovens worked upon the Dundonald principle (but, except in rare cases, without arrangements for the recovery of the by-products) have been in constant use. The more ancient ovens were circular, elliptical, or ovoid in plan, with a dome or cupola for a roof, the more recent, square or trapezoidal, with a cylindrical arch for a roof.

One of the former was provided with an air passage, which entered the masonry on each side of the doorway, passed all round about the chamber, and was connected with its interior by branches; a circular outlet for the products of combustion, which was probably also used for introducing part of the charge; and a cast-iron door. Its vertical walls were from  $2\frac{1}{2}$  to  $3\frac{1}{2}$  feet high, in some cases more; and its diameter or other dimensions varied from those required to accommodate a charge of  $1\frac{1}{2}$  tons up to those required for several tons.

Each oven was provided with a doorway at one side or one end, with an outlet for the gases in the top, and with one or more inlets for air. The charge was introduced through the doorway, or partly through the doorway, partly through a hole in the roof, and both of these openings were afterwards more or less completely closed.

The escaping gases passed into a short chimney and thence into the atmosphere. Circular ovens of this class, known as Beehive, have persisted up to the present day. The coke was drawn out through the doorway by means of a long iron rod bent into the form of a ring at one end to serve as a handle, and at right angles to itself at the other to serve as a hook.

The time required for coking varied from 48 to 72 hours, according to the magnitude of the charge; and the yield of coke varied from 50 to 65 per cent., according to the quality of coal and other circumstances. Many of these ovens produced a very fine, much-prized quality of coke. After a charge had been drawn out, the walls, as a rule, retained sufficient heat to ignite the following charge.

The work of drawing the hot coke out through a narrow doorway, in an oven of any shape whose diameter, or width, is greater than that of the doorway, is, as can be imagined, a most laborious and exhausting operation. This consideration led to the construction

of rectangular ovens of greater length than width, with a doorway of the full width of the oven at one end, and later, as will be seen further on, with a doorway at each end. When ovens of this shape with a doorway at one end—some of which are still in use—are about to be charged, an iron frame—frequently made of two pieces of old permanent-way rail, one as long, the other nearly as wide, as the oven, one end of the longer bar fixed at right angles to the middle of the shorter bar, and its other end provided with a strong link—is pushed in along the floor until the cross-bar touches the back wall.

The charge is then introduced and coked in the ordinary way. When the coke is ready to be drawn out, the door is removed, the charge is cooled with water inside the oven, a hook, at the end of a chain which extends from a windlass at the opposite side of the coke-bank, is passed through the link at the outer end of the long bar, and the charge is drawn out on to the coke-bank in one block. With long rectangular or trapezoidal ovens, which have a door at each end, the charge is pushed out by means of a ram with a shield at one end, and cooled with water, partly as it emerges from the oven, partly after it has fallen in pieces on the coke-bank.

Up to the year 1840 no attempt appears to have been made to apply heat generated by the combustion of the gases to the outside of the oven walls, with the object of coking the charge in its interior. At that date Cox obtained a patent for an oblong rectangular oven, with two cylindrical arches over the coking chamber, one above the other, with an empty space between them. The lower arch extended from the back to near the front, where it terminated, leaving a communicating passage between the space below it and the space above it, and air was admitted through holes in the back walls into the space between it and the top of the charge.

The products of combustion thus passed from back to front under the lower arch, then up into the space between the two arches, then back over the lower arch into the flue, and so up the chimney. This appears to have been the first attempt made to increase the heat of the chamber by circulating the hot gases on the outer side of one of its walls.

It would be difficult to trace the exact course of events during the next twenty years, but the following extract, translated from the writings of a contemporary writer, will serve the purpose of throwing some light upon it.

Writing in 1858, Hartmann says: "Improvements in the process of coking have, during recent years, been the object of many experiments and investigations, in Belgium and Rheinland, which are not yet terminated. . . . The object of these improvements has been to produce better coke, to reduce the time required in coking it, and to obtain a better yield, so as to be able to compete with English coke, which is made of the best materials, and is of exceptionally good quality.

"In the whole of these investigations one principle whose practical application has been sought for in many different ways, has been steadily kept in view—namely, to employ the waste heat in order to effect the distillation of the charge. . . . It stands to reason that this object can be effected only by means of more or less complicated apparatus.

"In all these improvements the main problem has been to prevent the consumption of coal through contact with air outside the oven, and to subject every part of the oven to a uniform temperature. . . . This objec

was sought to be obtained in Belgium by the construction of ovens of very small dimensions, and by associating a number of ovens together in one system, in which the waste heat of one oven could be employed in heating the coal newly charged into another oven. . . . This was effected by conducting the gases through flues below and in the side walls of the ovens, and extracting as much heat from them as possible before allowing them to escape into the air.

"It must be remarked in this place that the actual combustion of the gases was not contemplated, except in the case of a few ovens. At first, apparently, the contact of the hot gases with the walls of the ovens was all that was thought of, although it is obviously in the combustion of these gases that their greatest heating power lies; and in the case of most ovens even now without this being the intention of their constructors, combustion takes place by the leakage of air through the open joints of the brickwork at the ends of the horizontal flues. . . . The Talbot and Dulait ovens constitute an exception to this rule, as provision is made in both for the complete combustion of the gases.

"The construction of the flues in detail can naturally be carried out in many different ways; for instance, ovens have been placed one above the other, one alongside the other, or end to end, or two or three ovens, or a whole row, have been built in a range and so on.

"This principle was obviously carried too far in Belgium, as is best illustrated by the greater simplicity recently introduced in the suppression of many of the flues whose useful effect upon the ovens did not appear to compensate for their great cost.

"Nevertheless, heating the floor and side walls of the ovens by means of the waste heat must continue to be the guiding principle in all cases."

After expressing himself thus, Hartmann proceeds to compare the results of coking coal in the newer with that of coking it in the older ovens, and draws the conclusion that the newer ovens are really cheaper in first cost than the older ones, since they occupy less space and yield a greater quantity of coke than is necessary to compensate for their higher first cost.

During the years of experiment and investigation spoken of by Hartmann, the retort-oven proper was thus evolved and brought into active use, and all the improvements that have been added to it since then have been simply modifications in its structure and dimensions.

Writing in 1846, Scheerer described certain coking ovens in use at that time at some of the ironworks in Germany (Gleiwitz in particular), from which the volatile products were led away in pipes to condensers for the purpose of recovering a certain quantity of tar from them, which could be usefully employed on the spot.

Each oven stood alone, was cylindrical to about two-thirds of its height, and was covered in by a hemispherical dome. It had a doorway on one side, extending from the floor to about one-half of its internal height; a second circular opening in the dome, of a little less than one-half its diameter; an outlet pipe say 9 inches in diameter, extending horizontally through its walls from the apex of the dome on the side opposite to the door, to the condenser; five rows of holes equally spaced radially round about its periphery, all the holes of each row being in the same horizontal plane, the lowest row close to the floor, the highest row near the apex of the dome, and the intermediate rows spaced equally between the highest and the lowest; and lastly, some similar holes in its floor, communicating with a space excavated

for this purpose below the latter, into which air could be drawn from the outside. Each of the holes in the sides and floor was formed by building a cast-iron pipe of 1½ inch internal diameter in the masonry.

The oven was charged, partly through the doorway, partly through the opening in the dome, with 35 to 40 cwt. of large coal. The largest pieces were placed next the floor and built together in such a manner as to enclose a hollow space into which fire could be introduced from the doorway. The charge extended up to the lower side of the outlet pipe, and thus almost completely filled the oven. After the charge had been introduced the doorway was then built up with masonry to the level of the kindling hole, all the radial holes except those of the lowest row were closed with well fitting plugs, and a cast-iron door was placed on the hole in the dome and made air-tight. Soon after lighting the charge the upper part of the doorway was built up and luted with clay.

When the coal opposite the lowest row of holes showed an orange-coloured glow, that row was plugged and the next higher one opened, and so on with the others. About 36 or 40 hours after ignition the time had arrived to plug the highest row. Then the oven was allowed to cool for 12 hours, the door was pulled down, and the coke drawn out and extinguished with water. The yield of coke is said to have been 53 per cent, but the quantity of tar obtained is not mentioned. This oven appears to have been a modification of Lord Dundonald's, and it would therefore be interesting to know whether it was in reality a survival from the closing years of the eighteenth century, when the patent for its use was granted.

In 1862 Pernolet obtained a patent for an oven which he described as intended to "utilize the products of distillation of coal so as to reduce the price of coke," and in 1864 he read a paper on the subject before the Institution of Civil Engineers. It was a beehive oven into which no air was admitted; the heat was applied only underneath its floor; the volatile products were conducted in pipes to condensers and scrubbers, in which the tarry matters and ammonia were separated from the permanent gases; the latter could then either be used for lighting purposes or returned to the ovens and burnt in the flues beneath them—or partly one, partly the other. The quantity of gas thus obtained was obviously thought or found by experience, to be insufficient to generate all the heat required, for each oven was provided, in addition, with a furnace and fire-bars underneath its floor, on which coke breeze, waste coke, and, if necessary, small coal, could be burned so as to supply the deficiency. Pernolet claimed that his ovens gave the following results:—

|            | Per cent. |
|------------|-----------|
| Coke ..... | 69.3      |
| Tar .....  | 3.0       |

Sulphate of ammonia (10 lb. per ton of coal) . . . . 0.44

Mr. A. L. Stevenson (vide Transactions of the North of England Institute of Mining and Mechanical Engineers), who employed 36 Pernolet ovens in the North of England for a number of years, and experimented with various modifications of ovens of the Pernolet type, says he found that the beehive shape, 11 feet in diameter, gave the best results, namely:—

|                                                  | Per cent. |
|--------------------------------------------------|-----------|
| Coke .....                                       | 68        |
| Tar .....                                        | 2.40      |
| Sulphate of ammonia (4.14 lb. per ton of coal) . | 0.185     |

He remarks further that the coal was soft and the expense of repairs great, and that, as a consequence, the system was abandoned. He also states that he examined 120 Pernolet ovens employed at the Wigan Coal and Iron Company's works, and that they appeared to give somewhat better results than his own. A good many Pernolet ovens are said to have been erected on the Continent.

Enough has been said to show the genesis of the modern coking oven, including its use as a retort and hence as a source of liquid by-products and gas; it would therefore serve no particular purpose, however interesting it might be from an historical point of view, to minutely describe the process of coking on circular and oblong heaps or piles. The Schaumburg kiln, Smet's, Appolt's, Talbot's, E. Jones's, and many other ovens now passed into oblivion, some of which have contributed one or more of the details of construction and methods of working embodied in modern practice. The long, narrow, high retort-oven, heated by the combustion of gas in its flues; the method of charging through holes in the top; the door constructed of fire-bricks held together in an iron frame, and raised and lowered by means of a chain; the ram for discharging the coke; the employment of waste gases under steam boilers; and the condensation and collection of liquid by-products were all in operation before the year 1860; and the last link in the chain—Pernolet's system of returning the non-condensable gases to the ovens, with the object of burning them in the flues beneath their floors, and thereby coking, or assisting to coke, the charge—was patented in 1862.

During the years that have elapsed since 1862 much skill and ingenuity have been exercised in perfecting the details of the modern coking oven, which is now gradually eliminating all its more ancient rivals from the field. The success of these efforts is best illustrated by the fact that in the most recent type of ovens the economy of heat is so great that after the tar and ammonia have been extracted only one-half of the permanent gas is required to coke the coal, and the other half is available for steam-raising or for use in gas engines. The yield of these ovens per ton of coal coked is given by Mr. Hann as follows:—

|                                       | Per cent. |
|---------------------------------------|-----------|
| Coke .....                            | 80        |
| Breeze .....                          | 1.75      |
| Tar .....                             | 1.63      |
| Sulphate of ammonia (19.5 lbs.) ..... | 0.87      |

### WESTERN COPPER COMPANY'S MINES, NEW-FOUNDLAND.

By H. V. Smythe, Mgr. Western Copper Co.

The mines of the Western Copper Company are situated at York Harbor, bay of Islands, on the west coast of Newfoundland. The harbor is safe and ample, about six miles in length by three in breadth, and is surrounded by very high land, except at its head, where there is a wide and level stretch of country reaching inland. A large island, Governor's Island, lies in the centre of the harbor, and affords complete shelter to shipping of any size.

The hills on the eastern side of the harbor, where the Western Copper Company's mine is situated, rise abruptly from the waterside, and attain an elevation of 2,125 feet at a little distance inland in what is

known as the Blow-me-down Mountains. The western slope has several minor ridges or foothills, intersected by ravines, through which brooks of considerable size flow out into York Harbor.

The mine is located at the head of what is known as Eagle Nest Brook, is about three-quarters of a mile from the shipping, and is at an elevation of about 1,000 feet above tidewater. The geological structure of this district is similar to that of Notre Dame Bay, which has proved a profitable copper-producing district. The rocks consist of the metamorphic metalliferous zone of eastern North America. Wherever this series occurs in Newfoundland it has proved highly metalliferous, all the copper deposits of Notre Dame or White Bays being in the same series. The copper-bearing rock forming the ore channels is a dark green to black serpentine being an altered diorite, which is the common or country rock. The serpentine band is of unknown width, and contains superimposed, lenticular masses of low-grade chalcopyrite. These ore-masses vary in size being found crushed or broken near the surface and in solid masses of many thousands of tons as depth is attained. The ore is compact and close-grained, containing about 4.5 per cent. copper and 38 to 41 per cent. sulphur. It is in demand in both Europe and the United States as a fluxing medium, the sulphur being extracted and used in the manufacture of sulphuric acid.

The general trend of the ore-bearing serpentine belt is northeast and southwest with a dip of about 72 degrees southeast, the ore-masses practically conforming to the same trend and dip.

The Western Copper Company's mine is 360 feet in depth. It has three shafts, one of which, the main, is used for hoisting, the other two for pumping and ventilating purposes only. The main shaft is sunk at an angle of 72 degrees southeast, or practically the dip of the ore lenses. At every 60 feet levels have been driven to the southwest along the strike of the ore bodies, and where they occur mining has been carried on by means of overhead stopes. As these stopes average from 10 to 30 feet in width, heavy 12 x 12 inch timbers are used in "square sets" to support the back or roof where the ore has been removed.

At present the company is not actively mining the property, but are locating and developing new ore bodies shipping what is taken out during development. They have now between 30,000 and 40,000 tons of ore in sight added to which another series of lenses is being opened up of sufficient depth to more than double that amount.

The plant is well equipped with machinery for both mining and transportation, and there are good shipping facilities. Air drills are used, compressed air being supplied by a Norwalk high-altitude compressor. The ore is hoisted from the mine in an automatic self-dumping skip of one ton capacity by means of a 50 hp. Flory hoist. The ore goes through a crusher, which reduces it to size that will pass through a ring of 6 inches diameter. From the crusher it passes to cars on the main tramway, and these are then lowered to the main tramway by means of powerful winding engines.

The tramway is 5,400 feet in length, dipping 1,000 feet in that distance. The track is 3 foot gauge, and the train consists of two steel self-dumping cars carrying tons each. These cars shoot the ore into a pocket, the capacity of which is 2,000 tons. Underneath the pocket is a double-tracked tunnel, both sides of which are fitted with shute gates. This tunnel connects with the superstructure of the pier, over which cars carrying one to each are pushed and tipped into the hold of the steamer.

By means of this apparatus about 700 tons of ore per day can be loaded into the hold of the steamer.

Besides the property described, the Western Copper Co. has two adjoining areas both having extensive surface indications of copper. To the west and adjoining this

property an English and Canadian syndicate have taken up several square miles, and are engaged in prospecting. The results have been satisfactory, and warrant the expenditure of a considerable amount of money on its further development.

## THE ACTION OF ORGANIC SULPHUR IN COAL DURING THE COKING PROCESS.

By A. L. McCallum, B. Sc., Halifax. Read 12th February, 1908.

I was led to undertake this investigation by the conflicting statements of the authorities as to the action of organic sulphur during the coking process. Some say that the whole of the organic sulphur remains in the coke, others that part is volatilized, and still others that all the organic sulphur is driven off in the coking process. It is barely possible that all these statements are true of different coals, but I wanted, if possible, to find out what was the case with a typical Nova Scotia coking coal.

It occurred to me that if I could get a series of samples with a decreasing amount of inorganic sulphur and an increasing amount of organic, I would be able to get some data on the above subject, by determining the amount of inorganic and organic sulphur, and at the same time the amounts of volatile and fixed sulphur in the various samples.

It might be well at this point to say a few words as to the manner in which sulphur occurs in coal. To the best of our knowledge sulphur occurs in three forms in coal:—(1) as sulphates; (2) as iron pyrites; (3) as organic sulphur.

The coal used in this investigation was practically free from sulphates so that we have the two latter forms only to deal with.

The action of iron pyrites when subjected to heat without access of air is well known. There is loss of one atom of sulphur according to the equation  $\text{Fe S}_2 = \text{Fe S} + \text{S}$ . The coke oven presents ample time and the necessary conditions for this reaction to be complete.

Not knowing in what state of combination the organic sulphur occurs in coal, it is impossible to say what effect the heat of the coke oven will have. It was, as previously stated, in an attempt to throw some light on this question, that the investigation was undertaken.

Now to return to our coal samples. The only way to obtain such a series of samples as previously mentioned, viz.: with decreasing inorganic and increasing organic sulphur was to fractionate the coal on the basis of specific gravity, that is to separate it into several fractions of gradually decreasing specific gravity. The means used to accomplish this were solutions of calcium chloride of varying specific gravities. The coal used was crushed to pass through 1-12 inch mesh screen and was then placed in a vessel containing a solution of calcium chloride of slightly higher specific gravity than that of coal.

For instance, the raw coal was found to have a specific gravity of 1.323. For this a calcium chloride

solution of 1.35 specific gravity was used. This separated the coal into two fractions having the following specific gravities: the lighter material 1.275, and the heavier 1.731.

Part of this lighter or floating fraction was reserved for analysis and the remainder was treated with a calcium chloride solution of lower specific gravity. This procedure was kept up until, at a specific gravity of 1.24, there was no floating fraction.

Between these two extremes I obtained five fractions of the following respective specific gravities:

|             |       |
|-------------|-------|
| No. 1 ..... | 1.323 |
| No. 2 ..... | 1.275 |
| No. 3 ..... | 1.261 |
| No. 4 ..... | 1.253 |
| No. 5 ..... | 1.243 |

The proximate analyses of these samples are as follows:—

TABLE I.

| No.    | Volatile matter. | Fixed Carbon. | Ash. | Sulphur. | Sulphur in Coke. |
|--------|------------------|---------------|------|----------|------------------|
| 1..... | 35.10            | 59.74         | 5.16 | 2.06     | 1.80             |
| 2..... | 35.92            | 61.57         | 2.51 | 1.29     | 1.17             |
| 3..... | 36.10            | 62.27         | 1.63 | 1.09     | .85              |
| 4..... | 37.47            | 61.50         | 1.03 | .95      | .78              |
| 5..... | 37.75            | 61.35         | .90  | .88      | .68              |

The only method at present available for the determination of the organic sulphur in coal is by difference, and there is one inherent source of error which, however, I think is not material. The method referred to is as follows:—The percentage of iron is determined. Then this iron is combined with the necessary amount of sulphur to form iron pyrites ( $\text{Fe S}_2$ ). This amount of sulphur is deducted from the total amount in the coal and the balance is called organic sulphur.

The error referred to in this method is due to the fact that it is almost certain that there is some iron present as silicate in the "stone and shade" which are always present in the coal. But as the percentage of iron in the "stone and shale" rarely exceeds 3 per cent. and the percentage of stone and shale in the coal under consideration rarely exceeds 5 per cent. of the coal by weight, it will readily be seen that any error introduced will be exceedingly small.

Applying this method to the samples under consideration, we obtain the figures given in the Table II.

TABLE II.

| No.     | Organic sulphur. | Inorganic sulphur |
|---------|------------------|-------------------|
| 1 ..... | 37.86%           | 62.14%            |
| 2 ..... | 56.59%           | 43.41%            |
| 3 ..... | 71.56%           | 28.44%            |
| 4 ..... | 83.16%           | 16.84%            |
| 5 ..... | 85.23%           | 14.77%            |

We have thus clearly obtained a series of samples with gradually decreasing inorganic and increasing organic sulphurs.

There is also another way in which the total sulphur may be distributed, viz.: as volatile and fixed sulphur; meaning of course, that sulphur which escapes during the coking process and that which remains in the coke. The method used in obtaining this information is to first determine the total sulphur in the coal and then the total sulphur in the coke produced from that particular coal. From this it is easy to calculate the amount of sulphur volatilized.

Table III. gives the figures thus obtained.

TABLE III.

| No.     | Volatile sulphur. | Fixed sulphur. |
|---------|-------------------|----------------|
| 1 ..... | 33.49%            | 66.51%         |
| 2 ..... | 42.64%            | 57.36%         |
| 3 ..... | 50.46%            | 49.54%         |
| 4 ..... | 49.47%            | 50.46%         |
| 5 ..... | 52.27%            | 47.73%         |

There is not the same regularity as shown in Table II, but there seems to be an increase in the amount of volatile sulphur in those samples having a high percentage of organic sulphur.

Now if the only sulphur volatilized was the one atom of sulphur in pyrites according to the above mentioned equation, we can calculate what the percentage of volatile sulphur should be; because the sulphur called inorganic is assumed to be present as iron pyrites. So that if we take half the inorganic sulphur it should correspond with the percentage of volatile sulphur if the above supposition is true, and also if there is no organic sulphur volatilized.

The result of this calculation is given in Table IV.

| No.     | One half the Inorganic sulphur. | Volatize sulphur | Difference. |
|---------|---------------------------------|------------------|-------------|
| 1 ..... | 31.07                           | 33.49            | 2.42        |
| 2 ..... | 21.70                           | 42.64            | 20.94       |
| 3 ..... | 14.22                           | 50.46            | 36.24       |
| 4 ..... | 8.42                            | 49.47            | 41.05       |
| 5 ..... | 7.38                            | 52.27            | 44.89       |

This would seem to indicate that when the inorganic sulphur was in excess the above supposition is approximately true, but that it does not hold at all when the organic is in excess. It seems rather strange why this should be so unless it is due to mass action.

I think we are perfectly justified in concluding that in the coking process a very considerable part of the organic sulphur is volatilized.

In 1907 Canada exported 7,419 tons of coal to the Hawaiian Islands. During 1908 only 1,548 tons were exported.

## COAL-CUTTING MACHINES.

Mr. R. D. Bain, the Chief Inspector of Mines in the Durham District, England, states that there is an increase of 23 coal-cutting machines as compared with the previous year, the total now being 175 for the district. Both electricity and compressed air are used, but the larger number use compressed air, as it is more easily handled, assists ventilation and is less liable to accidents in fiery mines, but the leakage is greater when working at a long distance from the face. With the eight-hour day established I anticipate a much larger use of coal-cutting machinery in collieries, as all labour-saving devices must be used to enable British coal-owners to compete with Continental mines, where labour is cheaper and the hours worked greater than in this country. It has been found in Rand experience that the loss of air is less when it is transmitted in large piping, the pressure being much heavier when small pipes are used, and this factor should not be lost sight of in the utilization of compressed air in collieries.

It has also been found that when the coal seams and other conditions are favourable, the output per man may be doubled when machines are used, while the cost of production is appreciably reduced and an increased value of the output per ton is obtained, the proportion of round coal being increased with machines by 25 per cent. Besides, the coal mined is firmer and in better condition, and a more regular line of face is obtained by machines, and fewer explosives are required in breaking down the coal.

Although coal-cutting machines were introduced in Great Britain 50 years ago, in 1902 there were only 166 machines used, while in 1907 there were 1,493 machines in use. In the United States of America there were 10,212 machines in use in 1906, and the percentage of the total coal mined by machinery was more than 30 per cent. Each machine used in the United States showed an average annual production of 11,638 tons, as compared with 8,630 tons in Great Britain. In the United States the total number employed in coal mines was 940,618 persons; in Great Britain a total of 1,059,028 persons were employed in the industry. With fewer men the United States produced 60 per cent. more coal than was produced in Great Britain, largely due to the more extensive use of coal-cutting machines and the larger output of coal per machine.

## NEW MEMBERS—C.M.I.

The following gentlemen were elected to membership at a Council Meeting held on July 15th, 1909.

### Members.

Anderson, Glenn, Mgr. King Edward Mine, Cobalt, Ont.  
 Bailey, Frank, Merritt, Nicola Valley, B.C.  
 Brown, H. L., Mgr. Silver Cross Mine, Giroux Lake Ont.  
 Burnett, A., B. C. Copper Co., Greenwood, B.C.  
 Cameron, John A., Nugget Mine, Giroux Lake, Ont.  
 Chipman, K. G., Geological Survey, Ottawa, Ont.  
 Colvocaresses, G. M., Mgr. Blackburn Mine, Box 607 Gow Ganda, Ont.  
 Dickerman, Allan G., 60 State St., Boston, Mass., U.S.A.  
 Fournier, A., Mgr. Selkirk Mining Co., Ltd., Box 474 Kaslo, B.C.  
 Graham, Chas., Box 269, Nanaimo, B.C.  
 Gray, F. W., Box 225, Sydney, N. S.  
 Groch, Frank, Box 780, Cobalt, Ont.

Groch, Nicholas, C., Box 780, Cobalt, Ont.  
 Hamilton, W. L., Mgr. Leitch Collieries, Ltd., Passburg, Alta.  
 Hinton, R. W., Nelson Iron Works, Nelson, B.C.  
 Little, B. P., Box 1439, Vancouver, B. C.  
 MacMillan, John H., Mgr. Royal Collieries, Lethbridge, Alta.  
 McLaren, Geo. R., Box 247, Perth, Ont.  
 Mavor, Sam, 47 King St., Bridgeton, Glasgow, Scotland.  
 Meek, H. C., Supt. Crean Hill Mine, Crean Hill, Ont.  
 Muller, Alfred, Canadian American Coal and Coke Co., Frank, Alta.  
 Neilly, B., Silver Queen Mine, Cobalt, Ont.  
 Oliver, Chas. E., Dominion Mine Corporation, Hedley, B. C.  
 Ramsay, J. D. 1305 Trader's Bank Building, Toronto, Ont.  
 Rennie, Jas., Mgr. Casey Cobalt Silver Mining Co., Ltd., Box 88, Cobalt, Ont.  
 Robert, L. P., West Canadian Collieries, Blairmore, Alta.  
 Stilwell, Geo., Mgr. Hewitt Mine, Silvertown, B. C.  
 Stovel, Jas. H., Supt. Cobalt Central Mines, Cobalt, Ont.  
 Taylor, R. F., Supt. Nova Scotia Mine, Cobalt, Ont.  
 Thorne, Stuart M., Supt. Silver Leaf Mining Co., Giroux Lake, Ont.  
 Watson, Chas. E., Mgr. Chambers-Ferland Mining Co., Cobalt, Ont.  
 Whitto, E. P., Mgr. Standard Lethbridge Coal Co., Lethbridge, Alta.  
 Woolsey, Wm. J., Thetford Mines, Que.  
 Wright, Sidney B., Supt. Deloro Mining and Reduction Co., Deloro, Ont.

#### Associates.

Castleman, S. J., Box 1162, Vancouver, B.C.  
 Dempsie, E., Mgr. Maple Leaf Coal Co., Bellevue, Alta.  
 Jemmett, D. L., Mgr. Northern Canada Supply Co., Cobalt, Ont.  
 Richardson, Chas., Box 161, Haileybury, Ont.  
 Skill, Albert, Mining Recorder, Elk Lake, Ont.  
 Smith, A. A., Mgr. Badger Mine, Box 751, Cobalt, Ont.  
 Wheaton, W. A., Mgr. Royal Bank of Canada, Cobalt, Ont.  
 Wilkie, John B., Royal Collieries, Ltd., Lethbridge, Alta.

Campbell, Angus D., c/o O'Brien Mine, Cobalt, Ont.  
 Grant, Russel R., 106 Warren Road, Toronto, Ont.

### THE RAND A GREAT MINING MACHINERY MARKET.

According to the President of the Johannesburg Chamber of Trade, the value of the machinery and stores consumed by the mines and works in the Transvaal during 1908 amounted to almost nine and a-half millions sterling, an increase of £930,000 over 1907. Only about £300,000 was imported direct by the companies, the remainder being obtained through local firms. Practically all the principal manufacturers of mining machinery in the world are represented on the Rand through their agents. The manufacturers are kept in close touch with the consumer. The engineers and managers are regularly informed as to the developments which take place in the design and manufac-

ture of special machinery, tools, &c., and the manufacturers are kept fully advised of the requirements of this important market. This is done to a degree that would be impossible through any other source than that of the manufacturers' own representatives.

Mr. Niven, the President, added:—"It must be remembered that we are living in times of extraordinary and rapid advancement in technical matters, and the mining engineers and managers have neither the time nor the opportunity of closely following these. The local merchant or agent, however, makes it his business to do so; that is one of the reasons for being here, and if no other object were attained than that I have indicated, then I say he has justified his existence as a most important factor in the development of this huge industry. There are, however, other reasons why any change as suggested would not be in the best interests of the mines. Few manufacturers abroad, if any, will undertake to deliver goods in Johannesburg or on the mines, 6,000 miles away. They require payment in full for goods supplied, against bill of lading in London, and will accept no responsibility after shipment has been made. If, on the arrival at destination, as not infrequently happens when orders are sent direct, the goods are not up to specification or are from any reason unsuitable, the mine has no redress, having already paid for them, and the result is trouble, inconvenience, delay and loss. This does not occur where orders are placed locally. The firm here takes good care that their principal supply is exactly what is wanted. They are responsible for delivery in good order on the mines, and up to the time promised; and the mine authorities have someone here on the spot to whom they look for the due fulfilment of the contract. I am sure that the men who control the mining industry, as well as the engineers and managers, would be the first to acknowledge that the position is as I have stated it, and I think we need have no fear that any change in this respect is ever likely to take place."

### MINING IN ATLIN, BRITISH COLUMBIA, 1898-1908.

In the July Quarterly Bulletin of the Canadian Mining Institute, Rosalind Watson Young, of Victoria, B.C., writes interestingly of mining in Atlin.

During the past ten years (1898-1908) about six million dollars has been obtained from streams draining an area of less than fifteen square miles. The Provincial Government levies a tax of two per cent. upon all outputs exceeding two thousand dollars. Each year a great deal of gold passed out of Atlin without being declared for royalty, and without being in any way recorded. Hence the following figures are merely approximations.

Output Atlin Mining Division for years 1898-1908:—

|            |          |
|------------|----------|
| 1898 ..... | \$75,000 |
| 1899 ..... | 800,000  |
| 1900 ..... | 450,000  |
| 1901 ..... | 300,000  |
| 1902 ..... | 400,000  |
| 1903 ..... | 440,000  |
| 1904 ..... | 530,000  |
| 1905 ..... | 475,000  |
| 1906 ..... | 455,000  |
| 1907 ..... | 408,000  |
| 1908 ..... | 200,000  |

Total.....\$4,533,000

This total furnished by the Government is considered too low by Mr. Young, who places it at \$6,000,000. The average number of men employed each year has been about 600. This gives a per capita yield of one thousand dollars.

The small yield recorded in 1908 is attributable to the fact that one of the three largest operating companies did not operate, and the remaining two devoted part of their time to improving their water systems.

Gold was discovered in Atlin first by two partners, Fritz Miller, a German, and Kenneth MacLaren, a Canadian. Six miles from the mouth of Pine Creek they made their discovery. This area has proved the richest in the district. Before autumn, three thousand men had found their way to the camp. It is noteworthy that all the creeks that have been gold producers were staked during this first summer. Only four hundred people wintered in Atlin, but in the following spring there were thousands of new arrivals.

At first there was uncertainty as to whether Atlin was in British Columbia or the Northwest Territories. A placer claim in the latter was 250 feet, and in British Columbia 100 feet. When it was established that Atlin was in British Columbia, the 250-foot claims were "jumped" and abundant material was prepared for years of litigation.

More trouble ensued when, in 1899, the B. C. Government passed an amendment to the Placer Act, excluding all who were not British subjects from holding claims. Although this "Alien Bill" was disallowed within a year, much harm was done. Hundreds of aliens left the camp; experienced miners became scarce, and capital was withdrawn and has ever since been shy.

At first all disputes had to be referred to Victoria; but in 1899 a Special Commissioner was sent to Atlin. Later, a Supreme Court judge visited Atlin each summer, and in 1904 Atlin was made a county for judicial purposes. After the first few years the Gold Commissioner was empowered to adjudicate upon many mining matters.

#### Gold-Bearing Creeks.

Practically all the placer gold of Atlin, except that from McKee Creek, has been derived from the Pine Creek valley, which is a wide valley extending some twenty-five miles eastward of Atlin Lake, and flanked to north and south by low ranges. The valley is drained by Surprise Lake and Pine Creek with their tributaries.

#### Geological Formation.

In 1899 Mr. J. C. Gwillim, then of the Geological Survey, made a log and compass traverse of the lakes, and a paced survey of the surrounding country. In his excellent report he shows that the gold series consists of magnesite, serpentine, pindolite, and actinolite slate. Intrusions of granite cut this series off on the north; to the south are quartzites, slates, and lime-stones. Most of the gold has been found in the gold series, a little in the slates, and almost none in the granite.

Practically no work has been done by the Survey since 1899. Geological investigation of the old water courses would be of great assistance to the miners. There have been several runs of gold; but the richest and most widespread occurs in the "old yellow deposit" of pre-glacial origin. At first, blue gravel was found overlying the yellow; but as work advanced on the benches the blue gravel disappeared, leaving only the yellow. The average value of the gold is twenty dollars an ounce.

#### Relative Value of Creeks.

The leading creeks in order of production, have been Pine, Spruce, and Boulder. In 1899 Pine Creek paid royalties on \$276,564; Spruce Creek, \$45,405; and Boulder, \$48,000. In 1904 the figures were: Pine, \$107,318; Spruce, \$101,557; and Boulder, \$107,906. In 1908 returns showed: Pine, \$46,719; Spruce, \$41,235; Boulder, \$15,200.

From Pine Creek the bulk of the gold has been won by companies; from Spruce Creek by individuals and partnerships.

For the first three years, 1898, 1899, and 1900, ordinary placer methods were employed. Especially for two and a half miles on Spruce Creek, Chinese pumps, water-wheels, drains, ditches, sluice boxes, and wing-dams crowded each other. Pick and shovel worked with good results.

#### Size of Placer Creek Claim.

The 100-foot claims soon proved too small to mine and stack tailings upon. So in 1901 the size of the placer claim was made 250 feet square. In 1906 the Placer Act was amended to make the width of the claim from base to base of the hill and 250 feet in the direction of the stream. An amendment in 1908 made the placer claim 1,000 feet wide and 250 feet in the direction of the stream.

In the years 1899, 1900, and 1901 two hundred and fifty-eight hydraulic leases were issued. Many of these conflicted with placer rights. During the last five years the Government has enforced rigidly the cancellation of all leases that did not comply with statutory conditions. Two hundred and fifty leases have been cancelled, and thus much ground has been thrown open for re-staking.

#### EXCHANGES.

**The Colliery Guardian, July 30, 1909.**—A calamitous explosion occurred at the Maypole colliery, near Urgan, on August 18, 1908. The enquiry has just been concluded. The opinion that the explosion was caused by a blown-out shot seems to have most reason. The Colliery Guardian refers to the folly of treating the "permitted" explosive as a "safe" explosive. While admitting fully the need of more inspectors, our contemporary emphatically declares "that one of the lessons of this enquiry is to strengthen the belief that the 'practical' man is by no means fitted, simply as such, to fill responsible positions in which he is called upon to exert his critical faculties." . . . "As regards the suggestion that the offices of foreman and shot-lighter should be kept separate, we are somewhat at a loss to understand the line of reasoning that has prompted the jury to make this suggestion; the duties are very nearly akin in many respects, and the foreman is probably the official best acquainted with the conditions under which a shot has to be fired." If the fireman is to be relieved from an excessive burden of work, the Guardian intimates that this can best be done by reducing the size of his district.

**The Iron and Coal Trades Review, August 6, 1909.**—The averting of a general coal strike in Great Britain is dwelt upon editorially by the Review. A strike of this kind would have been "a national calamity of the worst kind." Moderate counsels prevailed during the

closing negotiations. Notwithstanding the good offices of Mr. Winston Churchill and Mr. G. R. Askwith, K.C., a basis of agreement was not easily found. "Happily, however, it was eventually recognized . . . that concessions by both parties to the dispute were inevitable if industrial war was to be avoided."

Although partly of a provisional nature, says the Review, the agreement certainly provides a broad and substantial basis for the permanent settlement of the questions at issue. "On the main issue of the 50 per cent. minimum, or 6s. per day wage, the miners have been entirely successful having secured the recognition of that principal. . . . On the other hand, an arbitrator is to decide upon a basis price to govern the 50 per cent. minimum, and is to revise the scale of increments," taking into consideration the effect of the new minimum upon the relation between wages and prices.

The crisis is now over, and the outcome, while it certainly does not favour the colliery proprietors overmuch, may be described as "peace with honour." To these proprietors "the thanks of the country are due . . . for the way in which they have surrendered clearly established rights without getting much in exchange. . . . On the other hand, the action of the Miners' Federation of Great Britain cannot be regarded in a very favourable light." Labour leaders and officials have been guilty of "an arrogant parade of power which accords but too well with the truculent attitude taken up by labour and many of its self-styled leaders of late."

#### PERSONAL AND GENERAL.

Mr. H. Mortimer-Lamb was in Toronto on August 23rd.

Mr. Martin Nordegg has returned from a visit to the coal areas of the German Development Company in Alberta.

Mr. Paul S. Couldrey was presented with a silver loving cup on August 14th on the occasion of his resigning the post of general manager of the Josie Mine, Rossland, B.C. Mr. Couldrey has accepted a position with the British Columbia Copper Co., at Greenwood.

Mr. Allan Greenwell, editor of The Colliery Guardian, London, Eng., is in Toronto. Mr. Greenwell will probably visit Alberta and British Columbia before returning to England.

Mr. F. C. Armstead, supervising engineer of the stoker department of the Westinghouse Machine Company, who for a number of years, has been located at East Pittsburg, Pa., has moved his headquarters to the Westinghouse Works, Attica, N.Y., where the stokers are manufactured.

#### OBITUARY.

Andrew Colville, who died on July 15 at Nanaimo, Vancouver Island, British Columbia, was born in Blairtown, near Peterborough, Ontario. For several years he was a school teacher in that province, and there, too, attended a business college for a year. Leaving Canada in 1886, he proceeded to North Dakota, where for two years he engaged in farming, going thence to Montana to put in a year at railroad construction. In 1889, at Lethbridge, Alberta, he commenced coal mining, working there as a miner for four years. In 1897 he was appointed superintendent for the Electric Peak Coal Company, at Hoar, Montana. During 1898-9 he was in charge of the outside operations of the Diamond Coal Company, Diamondville, Wyoming, and in 1900 those of the Carbon Coal Company, Carbonado, Montana. In 1901 he went to the Crow's Nest Pass coal field, British Columbia, where, after having been for about two years overman of Nos. 2 and 3 mines, Coal Creek, he was made superintendent of the Crow's Nest Pass Coal Company's Coal Creek colliery. He filled that position satisfactorily for four years, when he resigned and went to Eastern Canada for six months. In July, 1908, he returned west, going to Nanaimo, but he did not again undertake the responsible duties of a coal mine superintendent. He died among friends (fellow-members of the Canadian Mining Institute), who had known for many years his worth as a man and his competency as a mine manager.

## CORRESPONDENCE.

Editor Canadian Mining Journal:

In the railway article in issue of August 15 reference is made to copper in the Eastern Townships in such a way that a stranger would understand that none of these deposits have been successfully worked, while as a matter of fact we have at Capleton, within a few miles of Sherbrooke, two of the biggest copper mines in Canada—the Capleton and the Eustis. The former is owned by the Nichols Chemical people, the latter by Col. Eustis, of Boston.

They have been in successful operation for around forty years. The Eustis is down over 3,000 feet, employs 150 to 175 hands, and produces about 1,500 tons of ore per week. The ore contains as high as 45 per cent. sulphur, and much of it is shipped to chemical firms in Boston, who take the sulphur, and the residue goes to the Eustis smelter in Norfolk, Va.

The Nichols Chemical Co. also take several hundreds of tons each month. No better equipped mine can be found, and men and property are well cared for, but as with the Capleton it is a close corporation, and no stock for sale, consequently is not advertised in the stock columns of our daily papers. The Capleton mine extracts the sulphur from its ore, and makes glauber salts, nitric and sulphuric acids, etc. These mines have made millions for the owners—Americans in both cases.

Over the range to the west is the Norton property, owned by A. O. Norton, the well-known manufacturer of ball-bearing jacks, of Boston. He has been systematically blocking out, not extracting ore, for a long time, and has a large tonnage in sight. He is said to be contemplating the erection of a smelter. To the north is the pioneer mine of the region, the Ascot, a well-

equipped property, under the management of John McCaw.

At Lake Memphremagog is the Smith property, now being actively developed, by the same people who are working the McDonald property in Weedon.

In Ditchfield a new property has recently been opened.

What the district needs is not ore, but a custom smelter, at some central point, like Sherbrooke. The ore in the Sherbrooke belt is pyrite, and not rich enough in copper to pay for shipping to England, but, as proved by the Eustis and Capleton, with proper capital and smelting facilities, can be made to pay handsomely.

K.

To the Editor Canadian Mining Journal, Toronto:

Sir,—In view of the recent attacks made in the London Mining Journal on mining administration in India, and also both directly and indirectly on the Director of the Geological Survey, we have deemed it advisable to send you the following extracts, one of which is taken from the Mining Journal of June 26th, 1909, page 801, and the other from the published evidence given by Sir Thomas Holland before the Royal Commission upon Decentralization, and published in Blue-book Cd. 4369 (Vol. X. of Minutes of Evidence, p. 47):—

From the Mining Journal of June 26th, 1909, p. 801, leading article headed "Mining Administration in British India."

"We cannot close our observations on the evidence tendered to the Commission without noting the light thrown by the report on the sincerity of Sir Thomas Holland's attempt to suggest that we had imputed corruption to Government officials in India. As an argument against the establishment of a separate Provincial Survey, the Director of the Geological Survey said:

"If I transferred an officer, say, to Burma, or any province beyond my control, and he was the officer who governed the granting of mining concessions, I have not the slightest doubt that within a year, if he had only ordinary intelligence, he would discover that his salary *would*\* be only a fraction of his income.' We do not remember even to have seen the Chief of what is professedly a scientific body so frankly confess his distrust of his colleagues' honesty and professional pride."

Evidence of Sir Thomas Holland, Director Geological Survey of India, published in Blue-book Cd. 4369, being Vol. X. of the Minutes of Evidence taken before the Royal Commission upon Decentralization in India, p. 47:

Question No. 43455: "Is not an officer who has to deal with mining concessions in any part of the world subject to great temptation?"

"Yes; if I transferred an officer, say, to Burma, or any province beyond my control, and he was the officer who governed the granting of mining concessions, I have not the slightest doubt that within a year, if he had only ordinary intelligence, he would discover that his salary *need*\* be only a fraction of his income."

(\*The italics are ours.)

By changing one word in quoting the Blue-book, the Mining Journal has altered the whole meaning of the remarks made by the Director. In view of the comments made, it is for the Mining Journal to prove that this misquotation is accidental. Having regard to the claim of the Mining Journal that it "circulates all over the world," the writer of the article must know that it will be read by many to whom the blue-books are not accessible, for no assistance has been given by a reference to the particular volume in which the Director's evidence is recorded. As the inaccurate quotation has already received a start of some weeks before reaching us in India, we shall be glad if, by publishing this letter, you will assist in preventing any further dissemination of a grossly unjust insinuation.

With this sample before them, we can safely leave your readers to estimate the value of the attacks on the Indian administration recently made in the Mining Journal.

Needless to add, the relation between us and Sir Thomas Holland is one of perfect and mutual confidence.

We have been unable to communicate with three of our colleagues who are at present absent in the field, but we are convinced that if they had the opportunity they would join with us in appending their signatures to this letter.

Editor Canadian Mining Journal:

In your issue of August 15th, I note among the personals from Sherbrooke, Que., reference to a visit of myself and the president of a dredge building company to the property of the Compton Gold Dredging Company, by which it would appear that the placing of a dredge on this property had been decided upon by the company, and this statement is somewhat misleading, although, I am quite aware, unintentionally so.

This property was tested last summer and considered to contain sufficient values in gold to possibly justify the placing of a dredge thereon. Further investigation, however, this year has caused serious doubts as to the advisability of going ahead without further tests, and it would perhaps be well to suspend judgment until such time as these further tests are made.

I might mention further that the company have sufficient funds subscribed to build a dredge, but in the

event of these further tests being unsatisfactory, such subscriptions will be returned in full, and the company is not offering any stock for sale at the present time.

Trusting that I am not imposing on your generosity in asking for space in your valuable columns for the above, I remain,

Yours very truly,

COMPTON GOLD DREDGING COMPANY.

J. F. McKenzie, President.

Montreal, August 24, 1909.

**The Mining Journal, August 7, 1908.**—Gold stealing on the Rand is the subject of renewed discussion. The Mining Journal supports certain preventive measures advocated by Mr. Albu. Chief among these measures is the arrangement of all amalgamation plates and extraction boxes under the control of the salaried staff. "In any case," says the Mining Journal, "whatever measures be taken, there can be no finality. As in all campaigns against fraud, it is a constant struggle of wits."

## SPECIAL CORRESPONDENCE

### NOVA SCOTIA.

**The U. M. W. A. and the Nova Scotia Coal Trade.**—The general situation that has been brought about in Nova Scotia by the policy of the United Mine Workers of America is a serious one for this Province, and it has already resulted in grave and permanent injury, not only to Nova Scotia, but to the Maritime Provinces as a whole. The question, however, is not a provincial one, nor is it one that is confined to the coal trade alone. It has a far wider import, and touches particularly the political independence of Canada. One feature of the U. M. W. A. platform is International Socialism, and it is this that has attracted to the ranks of the U. M. W. in Nova Scotia the miners who come from the countries of the Old World. The dream of the International Socialist of "The Parliament of Man, the Federation of the World," is an attractive one, and the arguments of the International Trades Unionists are seductive and plausible to the unthinking. But, after all, they are but dreams. Everything in a sovereign country must be subordinated to the national entity. Trades unionism is merely one of the components of the political life of this country, and it has no more right to override the limits of our frontiers than have the main divisions of our national political parties, nor has trades unionism any right to divorce itself from national economics. If it attempts to do so, disaster must surely result, as it has already resulted in Nova Scotia.

The legislators of our country, recognizing that the coal mines of the United States and those of Canada are competitors, or, to use a more fitting word, opponents of each other, imposed a protective duty on imports of coal from the United States into Canada. Our legislators, also, for the protection of the Canadian workman, passed the law known as the Alien Labor Act, which forbids to Canadian employers the opportunity of engaging workmen in the United States in competition with the citizens of this country. Our law also forbids any United States corporation from operating in Canada to the detriment of Canadian trade, and, before it will allow them to do business here, these corporations must be incorporated under our "Companies Act," and they must obey the constituted authority of this nation. These barriers, along with many others, have all been laboriously erected by our Parliament to protect Canadians and to consolidate our national growth. What has happened in Nova Scotia? This has happened: Under the name of trades unionism every one of the protective barriers erected by our legislators against the encroachments of the United States has been swept away; a direct attack has been made upon our coal industry by alien strike leaders engaged and paid in the United States out of the funds of a United States corporation, and the result is that American coal is now being unloaded in Sydney Harbour, while some three thousand Nova Scotia miners are idling on the streets of Glace Bay and of Springhill. We have said that all this has been done in the name of trades unionism,

but in reality what has happened is tantamount to sedition and to treason, which has been fomented by alien enemies who have conspired against our trade and to destroy our native institutions. That these enemies of our country have been helped in their work of destruction by some misguided citizens of Canada may add to the irony of the situation, but does not minimize the menace.

The policy and the actions of the United Mine Workers of America in Nova Scotia have not been those of a legitimate trade union, but they have been predatory, and foolish withal, and are calculated to work great harm to the proper aims of trades unionism. It is not calculated to advance the interests of labour for a powerful union to embark upon a policy of extermination against a smaller one, and this is what the U. M. W. A. have done. The claim of the Provincial Workmen's Association to represent the workmen of Cape Breton has been shown to be well founded. At Inverness and Port Hood the attempts of the U. M. W. to call a strike were abortive from the beginning, and to-day the president of the Inverness U. M. W. Local is working in the mines at Glace Bay. Despite all the assertions of the U. M. W. A. leaders to the contrary, we are in a position to know that the U. M. W. A. strikers at Glace Bay number less than one-third of the mine's force of the Dominion Coal Company, and less than one-fourth of the total number of that company's employees in Cape Breton. Taking into consideration the disparity in numbers between the U. M. W. sympathizers and the P. W. A. members, to the great disadvantage of the U. M. W., the fact that the Dominion Coal Company has a binding contract with its workmen, which precludes any possibility of change until 1910, the fact that a Board of Conciliation has strongly advised against the recognition of the U. M. W. and has upheld the position of the Coal Company in every particular, and the fact that the workmen of the Coal Company have no grievances which need redress, what should a wisely advised trades union have done in the case of the Glace Bay dispute? They should have retired in favor of the older union, or until a more favorable opportunity for success presented itself. But the U. M. W. A. leaders would not do this; instead they have engaged upon a useless and foregone struggle, in which they will find it necessary to dissipate a large portion of the accumulated funds which were contributed by American miners for the defence of their union in the coal fields of the United States. The leaders embarked upon the Glace Bay strike with the full knowledge that in order for the U. M. W. A. to succeed, the P. W. A.—a Canadian union—must be destroyed. In Inverness County the U. M. W. A. have thrown money away foolishly and without any return. At Springhill they have declared a strike for higher wages after a Board of Conciliation had proved absolutely that higher wages were impossible if the Cumberland Coal Company were to continue in business. At this place they withdrew the pumpmen and firemen, and but for the per-

sonal efforts of the officials of the company the Springhill mines would have been allowed to fill with water and gas, and the horses would have starved in the pit. Had they been able, the U. M. W. A. would have done the same thing at Glace Bay, and they did attempt at several of the mines to stop the operation of the boilers and pumps.

At Springhill the apparent result is going to be the closing of the mines of the Cumberland Coal & Railway Company, and eventually a reduction in the wages of the workmen.

What is the net result to Nova Scotia so far? First, a partial paralysis of the coal trade of the Province, coincident with the replacement of Nova Scotian coal by United States Coal.

Second, the harassing of the Provincial Workmen's Association, and financial loss to the workmen of the Province.

Third, a large expenditure of union funds for purposes altogether outside of unionism, this expenditure being made by men who are well aware that the money might just as well be thrown into the sea.

The attitude taken by these American strike-breeders towards Nova Scotian unions and Nova Scotian methods of doing business may be illustrated by quoting a few statements which have appeared in the public press from U.M.W.A. sources: The "Standard" recently taunted the management of the Coal Company on its inability to run a strike properly, giving as a reason for its opinion the inexperience of the Coal Company in strikes. On the other hand, the "Standard" praised the methods of the U.M.W.A., which, they stated, much practice had made perfect. If the worst that can be said about the management of the Dominion Coal Company is that this company's officers have had no experience of strikes, most sensible people will wish there were more such companies, and will regard the taunt as a genuine testimonial to the tactful management of the Coal Company, and the excellent relations which have existed hitherto between the workmen and the heads of the company.

Mr. McCullough, in attempting to defend his action in calling out the firemen and pumpmen at Springhill, writes: "The policy of the operators is to operate the mines of Nova Scotia with non-union labor, or the P.W.A., which means the same thing in the final analysis." This same gentleman, in a speech at Sydney, referred to Canadian soldiers as "paid pimps," and in a letter to the U.M.W. Journal he wrote that Nova Scotian newspapers were raising the cries of "Canada for the Canadians, Canadian National Unionism, and 'such rot.'" We wonder what would be the fate of any Canadian who said and did the things in the United States that Mr. McCullough and his colleagues have done in Nova Scotia. A Vigilance Committee, a fence-rail, and some tar and feathers would likely assist his ignominious exit.

### QUEBEC.

Sherbrooke—It is reported that the Spalding iron property has just been bonded for \$500,000, the lessees to expend \$50,000 in development work. Yet the deposit has been known for years. Those who might have taken it up didn't think it worth while, as good mines are always 'way off West.

The new Megantic copper property seems to show improved values in both gold and copper, as depth is gained.

The New York Engineering Co. is looking into the possibilities of gold placer ground in the Eastern Townships, particularly in Compton Co. Several other dredge-making concerns are endeavoring to get a contract from the Compton Gold Dredging Co., but the latter may naturally favour a concern that will get a good part of the machinery put up in Quebec.

Mr. John McGaw is pushing work vigorously on his property in Brampton.

The management of the Eastern Townships Agricultural Association has kindly granted space for a mineral exhibit at the

coming Fair, and all interested can send specimens, properly labelled, to Mr. Kenneth E. Kennedy, Sherbrooke, Que., with any particulars desired, and they will be taken care of, and arranged, also returned when desired.

In spite of all the newspaper space devoted to asbestos news, there are more properties that can be bought at reasonable prices than cash purchasers. All the present producing mines, not so very long ago, were prospects with no better surface showing than many of these. The claims so often made by self-styled authorities or "experts" that Thetford has all the good stuff, or that the present producing mines control all the good ground, is pretty likely to be exploded. Of course a prospect is not a mine, but all mines were once prospects. To hear some of these people talk, one would think that mines were found, not made.

It is true the Eastern Townships has no Alex. Gray to write of its mineral possibilities, and the larger city dailies, while devoting much space to Ontario mines, and even prospects, cater more to the stock selling side than to real mining.

These papers no doubt know which side their bread is buttered on, and having in mind some premature booming done for the higher lights, when British Columbia was to the fore, now do not dare refer to any new or promising region until it is vouched for by some gentleman eminent in some line quite apart from mining, but sufficiently well known to qualify as an authority, on account of his financial standing, on any old thing.

And yet it is more than edifying to read some of the stuff they do print. And in whose interest is it? Not that of the ordinary country reader, nor of the little old Province of Quebec.

### ONTARIO.

Cobalt—The Baily Mine has ordered a complete plant, excavations are now being made, and the ground is being cleared preparatory to erecting the necessary buildings. The plant consists of a compressor, a 100 horse-power boiler, a hoist, drills, and other necessary equipment.

A winze is being sunk from the 400-foot level of the Kerr Lake Mine, and will be continued 100 feet. This will give a total depth of 500 feet and will be the deepest working in the camp. So far as they have gone there has been no change in formation, and the ore continues to carry its high values. When the winze is completed a cross-cut will be run under the shaft, and the two levels will be connected at that point.

The Nancy Helen has struck high-grade ore in three new veins. Two of these are about an inch in width and carry ore assaying about 1,000 ounces in silver. These veins come off the Buffalo. The other one is about five inches in width and carries higher grade ore. This latter vein is apparently making for the City of Cobalt property. These finds were made on the sixty-foot level. The Nancy Helen resumed underground operations a short time ago, having been closed for some time while diamond drilling was going on.

Mr. George Taunt who is largely interested in the Lucky Boys and Chesterfield properties in the Larder Lake district, has interested some English capitalists in the Harris-Maxwell, on which they have an option. Mr. H. P. DePencier has been appointed manager of the Reddick. There are four steam drills working on this property testing the surface. The shaft is now down 120 feet, and there are said to be good values in the bottom. The Cleopatra, adjoining the Harris Maxwell, has a force of men working on the surface, and the results obtained so far have been very satisfactory.

The new surface vein found recently on the Nipissing has now been trenched for a distance of 200 feet and it shows a width of about six inches of high-grade ore. This is the most

valuable discovery for this company, since the big vein was found in the No. 64 shaft. Further development on vein No. 127, carrying smaltite and niccolite, has shown it to contain some values in native silver.

The Coniagas will build a shaft house over their working on the corner of Prospect avenue and Silver street, which is right in the centre of the town. The shaft will be sunk to a depth of 86 feet and at that point it will correspond to the 150-foot level of the main shaft.

The Temiskaming has good ore on the 300-foot level and is drifting on the No. 1 and No. 2 veins, while a crosscut is being run to catch the No. 3 vein. Good progress is being made with the concentrator, and the company hopes to have it completed about the end of December.

Much trenching is being carried on on the lots of the Gillies' Limit purchased from the Government, the finds recently made on the Waldman and Young-O'Brien lots, having given great encouragement to the owners of the other properties. The Waldman vein has been traced on the Young-O'Brien lot for a distance of 90 feet, and the values are very good. Next week forty men will start trenching the surface of the Cleopatra, which is owned by Mr. Bannell Sawyer, of Montreal.

A good discovery was made recently on the Silver Alliance property in the Elk Lake district. At a depth of twenty-five feet in the shaft the vein widened from a mere stringer to between six and eight inches of calcite carrying good values in native silver. The Silver Alliance property is situated in Tudhope Township about four miles from Elk Lake, and is owned by Montreal people. Another good find was made on the Haentschel claim in the Township of Farr on Panty Lake. It consists of a vein of calcite carrying values in native silver. The York claim, which is located near the Otisse Currie, located a vein on the surface carrying smaltite, niccolite and native silver. The vein was stripped for a considerable distance and is found to average about four inches in width.

The dispute between the Nova Scotia Mining Company and the Peterson Lake Mining Company has culminated in the issue of a high court writ against Edward and D. M. Steindler, in which the Peterson Lake people claim the following:

1. \$1,000,000 being the amount of shares of plaintiff's stock wrongfully issued to the defendants.
2. \$50,000, monies of the plaintiff's wrongfully appropriated by the defendant, Edward Steindler, with the aid and consent of his co-defendant.
3. In the alternative the like sums by way of damages for misfeasance and breach of trust on the part of the defendants as trustees for and directors and officers of the plaintiffs.
4. Delivery up and cancellation of the certificates now held by the defendants or either of them for stock of the plaintiffs.
5. An injunction restraining the defendants from acting as shareholders in respect of the stock issued to them and from selling, charging, parting with, or otherwise dealing with the shares of the plaintiffs' stock issued to them and still held by them, and also restraining the defendant, David M. Steindler, from acting as a director of the plaintiff company.
6. Such further and other relief as the plaintiffs may be entitled to.
7. Costs of this action.

In sinking on the No. 3 vein of the La Rose, the Keewatin came in at the 100-foot level, but the shaft was continued and is now thirty-five feet below the contact. The ore was found to continue and the high values were maintained. On the other side of the line the O'Brien is working on the same vein and is still taking out good ore. On the latter property the vein has been in the Keewatin all the way.

There is to be another sale of the mining lands of the Gillies' Limit comprising 393 acres remaining from the total of 870

originally offered. The bids previously put in for these lots were not considered high enough by the department but in view of the finds recently made on the Waldman and Young-O'Brien lots, they will probably now command higher prices. The Provincial Mine is also to be sold. This property consists of forty acres and is situated in the Savage and Silver Bar group near Cart Lake. It was closed down some time ago while some diamond drilling was being done. A hole was bored near the Savage Mine and at a depth of about 165 feet from the surface a vein carrying high-grade silver values was cut. Tenders for the lots and the mine will close on September 13th.

About two hundred feet from the Foster boundary and half way between the north and south lines a new find has been made on the Lawson that for width and values closely approaches the original silver sidewalk. When first found it was not considered remarkable, but a little development showed it to contain a good width of very high grade ore. In one place there is fifteen inches of cobalt assaying very high in silver. When the vein had been trenched for a short distance it was found to split at both the north and south ends, the branches being about six inches in width. This find was made in the Keewatin. This makes a total of seven veins found on the surface up to date and the probability is that underground development, as has been the case in other mines, will show up still more. Development on this property is at present limited on account of the small capacity of the compressor. The main working shaft will be the one that has been sunk on the main vein, and which is now down 98 feet.

Further development on the new find made at the Foster shows the vein to be from three to five inches wide. It is a cobalt vein and carries high values in silver. The opening up of the Lawson has led to a much more thorough prospecting of the Foster, and had the former properties not been tied up in litigation for so long these finds would probably have been made years ago.

Considerable interest continues to be manifested in the gold claims of Munroe Township, and work has been done on some of them. The principal properties there are the Green claim, the Kennedy claim, the Guelph Syndicate, the Surprise claim, the Painkiller Lake Mines, and the Wigwam claims. It is stated that the Kennedy claim has been sold to Mr. P. Farah.

The camp buildings of the University Mine were destroyed by a fire, which is supposed to have originated in the bunk house. The shaft house and power house were fortunately untouched, so that the work will be able to proceed without interruption. The University was an independent company until the original owners of the La Rose acquired control. The results obtained were not very encouraging and the mine closed down, until the La Rose Consolidated took charge and started work again. Since that time the outlook for the mine has been much improved.

The Northern Customs Concentrator, formerly known as the Muggley, is making progress with the addition to the mill. The buildings will shortly be completed and the machinery in place.

The district of South Lorraine continues to attract more and more attention, and the reports that come from there are very encouraging. A great amount of work is being done, and if the success obtained so far is any criterion it is safe to assume that this district will eventually become one of the most important outside of Cobalt. During the coming week the Keeley will ship one car of high-grade ore and one car of medium grade. So far this company has experienced considerable trouble with the plant that they installed a short time ago, but they expect to have it in good running order in a few days. The main development of the property is being carried on at the 130-foot level. The west shaft is being pumped out and when that is completed work will be started there also. The Wettlaufer will also ship forty tons of high-grade ore and probably a car of medium. Drifts are being run at the 60-foot level on

the vein on which the shaft was sunk. The vein is about six inches wide and carries a good amount of high-grade ore. A cross-cut was run from this level to a parallel vein on which drifts have also been run. This vein is about twelve inches wide with six inches of smaltite carrying silver.

#### BRITISH COLUMBIA.

**Rossland.**—Once again there is some stir and activity about the Le Roi mine, a small crew having been put to work getting things in form for the extensive development that will be done in the big mine during the next several months. It is stated that a fund of about two million has been raised by Managing Director McMillan and the Board of Directors, in order to carry out a big plan of development that was suggested by Mr. Carlyle. While the main work will be done from the 1,650 to the 2,650-foot level by diamond drill, operations will not be confined to that particular territory, but other promising regions of the Le Roi ground will be opened up. It is certainly pleasing to Rosslanders to see work once more going on at what we termed the "premier mine of the camp" until the Centre Star group forged to the lead.

Twenty tons of picked gold ore was shipped from the once prominent I. X. L. mine during the past week. The lessees keep working away in the altered depths of this property in a state of semi-excitement. While the ore they are extracting is about paying expenses, it is a gamble. Any day they may open up one of the old-time bonanza pockets, when they, the mine and the West belt will spring into sudden prominence. Every one in Rossland believes some one will strike it in O. K. Mountain some day, but the fates hold the secret as to who the lucky one will be. Both the O. K. and I. X. L. mines have been worked every few months by lessees, each party striking new ore and making their venture pay, but the expected grand coup is still to come off.

The Consolidated M. & S. Co. of Canada is making things hum about the Centre Star group here, and Dame Nature is doing her share by pushing goodly quantities of pay ore into the various workings of the mines. For the week ending July 24th the shipments from this property reached a new record figure for the current year, 4,680 tons having been sent to Trail smelter. This exceeded the prior high figure (4,280 tons for week ending May 1st) by 400 tons. The low shipment mark for the Centre Star this year was 2,950 tons during the week ending January 9th. The Consolidated St. Eugene mine at Moyie also broke a record in the early part of July, shipping for the week ending July 19th 975 tons, exceeding the week ending June 29th, when 807 tons were shipped. The Snowshoe mine of the Consolidated, not to be outdone, also made a new high record, shipping 4,083 tons for the week ending July 31st, the heaviest tonnage from the mine this year. These heavy shipments pouring into the bins of the company's smelter at Trail naturally make things lively at that point. The gross value of the output of this reduction works for the past month was over \$800,000. As everything points to heavier shipments than ever in the very near future, the plant is being enlarged as rapidly as possible, so that the anticipated work may be fully met when the proper time arrives. During the fiscal year ending June 30th this works produced gold, silver, copper and lead to the value of approximately five and a half million dollars. About 45,000 tons more of ore was treated than during the preceding year. From the electrolytic refinery \$2,700,000 of the output named above was derived. There is little doubt that the figures for the current fiscal year will far exceed those of the past year, provided, of course, no great drawback occurs. It is worthy of note that this modern refinery on the silvery Columbia has supplied the Mint at Ottawa with over 250,000 ounces of gold for

coins. Nearly 200,000 ounces of .999 fine silver is shipped from Trail each month to the Orient for coinage. To digress: What a strange story an ounce of this Canadian silver might tell could it speak and should it return to Canada years hence; a story of happiness and misery, cruelty and mercy, of life and death—it is more likely, however, to meet the fate of being buried in the ground by some wretched Oriental miser.

**The Boundary.**—Wheels are again getting into motion at the property of the British Columbia Copper Co., part of the crew having been put to work. As yet smelting operations have not been resumed, but there is little doubt the furnaces will be blown in as soon as ore and fuel conditions are in regular shape. As is the case with several of the other big mines of Southwestern British Columbia, the outlook for the B. C. Copper Co. is very good for the immediate future. It is very likely that a profitable arrangement will be made to smelt the ores of the mines of the New Dominion Copper Co., and with railway facilities to mines in nearby camps controlled by the Copper Co. a busy and profitable season of work is promised.

The mines of Phoenix have shipped over half a million tons of ore of a good average grade already this year and while the figures run somewhat below last year to this date, still if present plans here carry it is likely that last year's record will be passed easily. As is generally known, Boundary ore yields about 24 lbs. copper to the ton, so that the recovery thus far during the current calendar year has been over 24,000,000 of the red metal. Both the Granby and B. C. Copper Companies are turning out a good grade of crude copper from their smelting and converting plants, and can lay it down at Eastern refineries for approximately ten cents per pound. There have been months when this cost has dropped as low as eight cents per pound, but this figure cannot be counted on as a year in and year out cost just at this time. Men who ought to know, however, predict an average eight-cent cost for copper from the Boundary in the not distant future; this will be made possible by improved conditions both in the mines and in the smelting and converting plants; the converting itself figuring prominently in saving on freight.

The reorganization lately of several local mining and reduction companies of more or less prominence has ended disastrously for those of the shareholders who did not feel like complying with the "freeze-out" conditions laid down by the reorganization committees. In many cases investors bought stock at par for an "investment," figuring that the prominent men connected with the companies assured exemption from wildcat tactics, and that in due course of time they would receive some of the substantial profits which the mining industry as a whole is yielding to-day. The day is coming when a man who buys one share of stock in an incorporated company will have his interest protected but what can we do to hasten this state of things? It does not seem just that a wage-earner who stints himself of luxuries, we will say, and puts his savings into a corporation, in an effort to provide for that "rainy day" that we all fear, should lose that estate which in a crisis may mean life or death to himself and family, in order that certain predatory interests may acquire a valuable property at a mere pittance. When the show-down comes it is an uneven battle, an organized force versus a disorganized and helpless lot of shareholders. As a general thing, stock in a company is sold the first thing, and stands a paramount first mortgage against the concern; then those "inside," with the aid of their promoters stock and the proxies which the innocent shareholders send them, vote to mortgage everything, giving a first mortgage, and the stock that was previously secured by certain assets is converted into worthless paper, while the friends of the "insiders" get a strangle hold on the company that was put on its feet by the money of the small investor. The question is, who, or what organization, that is in the right position, is going to start the

work that will place the mining industry and the capitalization of its different branches on a plane that is above wildcatting? We have in our midst predatory trusts, workmen's unions and farmers' unions; the next big movement will be for a Consumers' Protective Association, for the others are getting too high-handed altogether, so what's the matter with an organization for investors that will fight their battles in Parliament and throughout the land? Its eye, if vigilant, might strike fear to the hearts of those Black Knights who would make a little easy money by aerial financial tactics.

**Nelson.**—Several of the French capitalists who are interested in the historic Blue Bell mine visited the district during the past week. It is announced that French capital is being consid-

erably attracted to British Columbia, and that large sums of money from Parisian capitalists will find their way to the mines of this country in the future. It would surprise most people to know how many coal and mineral properties are now controlled by French capital in this Province.

The old Fern mine has again been reopened, and is to be worked on a good scale. Another good strike is reported from the Westmount. A 3-foot vein has been uncovered in one of the lower levels. About twenty men are working on the property. Auriferous gravel that is said to run from \$10 to \$20 to the pan has been found on Summit Creek. This is not surprising when it is known that so much gold-bearing rock exists in the vicinity of this rivulet.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Sydney.**—The excavation work for the Dominion Iron and Steel Company's four batteries of new coke ovens is reported to be well advanced.

The four new batteries will comprise 30 ovens each, and the cost will be about a quarter of a million.

**Sydney, Aug. 24.**—More skilled miners went into the Dominion Coal Co.'s mines to-day. Of these, twenty-six arrived at Sydney last night from Inverness County and were taken immediately to Glace Bay by train. While this train was passing through Gardiner, near No. 1, two rifle shots were fired at it from the neighboring woods. Fortunately no one was hit. Yesterday's output at the mine was the best since the beginning of the strike, 6,470 tons being taken out of the pits and 4,862 from the banks, a total of 11,332 available for shipping. The steamer Dominion has sailed for Philadelphia to load a cargo of coal for the Steel Company.

Last week's shipments by the Dominion Coal Company were 60,011 tons, 48,071 by steamers; 3,079 by schooners, and the remainder, 8,869, by rail. Last week's shipments were the largest since the strike began.

**Glace Bay, N.S., Aug. 24.**—John Moffatt to-day answered the charge that the Provincial Workmen's Association brought about the present industrial strike in the Province by sacrificing their members' interests, when he issued a statement showing what that organization has done since he has become its head. To the charge made against him by a section of the Conservative press, that he has been the tool of operators, he replies showing the concessions he has secured for the men since he became grand secretary of the P. W. A. eleven years ago, including two general increases in wages and numerous partial ones.

The local industry was, he claims, materially aided by wage agreements whereby labour troubles were obviated for periods of years; double as much work secured, increased business thereby brought about, and improvement in working conditions, until the miners in Nova Scotia now labour amid surroundings unsurpassed anywhere for safety and sanitation. These are the main features of his administration which he points to in answer to the assertion that he has betrayed his trust.

### QUEBEC.

**Sherbrooke.**—The New York Engineering Co. has shipped two drillers, an Empire and an Empire, Jr., to be used in testing glacier ground in Compton. On one property, this will be the final test prior to installation of machinery, on others, more of a preliminary nature.

**Thetford Mines.**—Notwithstanding the apparently quiet state of the asbestos market, all the mines in this district continue to work to their full capacity day and night shifts, and there are

probably more men employed at present in connection with the mines than ever before.

Some of the mines have nearly completed large additional storage sheds, some are in course of construction, while others are contemplated. All of which would indicate that there will be no material cessation of operations during the coming winter.

A noticeable feature of the past few months, and particularly so considering the large number of men employed, is the fact that there have been very few strikes, either of a slight or serious nature. This is worthy of note, for an erroneous impression has existed that there are numerous and frequent accidents attendant to the mining and milling operations. In comparison with the many other extensive industries of the Province, in proportion to the number of men employed, the asbestos mining district will be found to show up most favourably with a very small percentage of accidents.

### ONTARIO.

**Cobalt.**—The Provincial Mine is supplying compressed air to the Waldman property near it on the Gillies' Limit and to the Gould Consolidated on Cart Lake.

**Cobalt.**—Both the Keeley and the Wettlaufer mine, South Lorrain, will ship ore this week (Aug. 21st).

The Page brothers, of Butte, Montana, who hold the world's championship for hand drilling, won the recent drilling contest in Cobalt. They drilled 43 1-8 inches in 15 minutes. The first prize was \$1,000.

**Cobalt.**—At the Nancy Helen mine three good veins were cut in the second week of August. None of these veins outcropped on the surface.

**Dryden.**—There is a probability that the Baden-Powell mine at Eagle River, which has been closed down for some time past, will again be re-opened, the management of the property having recently received instructions from headquarters relative to an early resumption of operations.

### BRITISH COLUMBIA.

**Fernie.**—The coal miners in the Crow's Nest country are forming a Canadian Mine Workers' Union being dissatisfied with the late strike called by the American officials and by the fact that the unions refused to financially aid the strikers called out under their rules.

**Coal Creek.**—On August 15 fire destroyed 16 buildings at Coal Creek, including the Coal Creek Club.

**Nelson.**—The compressor plant of the Hall mines was destroyed by fire on the morning of August 20. The loss will exceed \$15,000.

**Rossland.**—Reports from the property of the Fife Mines, Ltd., indicate that a fine body of gold-copper ore has been found.

**Nelson.**—The mining outlook in Kootenay continues to improve. The latest deal of importance has just been closed whereby a Nelson syndicate has purchased the well known Athabasca mine and mill situated on Toad Mountain. The property has yielded large returns in the past but has been closed down and in litigation for some years. The vendors were the Bank of Montreal. The property is equipped with a ten-stamp mill, ten-drill compressors and 35-ton cyanide plant and a half-mile of tramway. Electricity is the power used. The mine contains over two miles of workings. This is only one more instance of valuable properties being reworked.

An important strike of high-grade ore is reported on the Mother Lode mine at Salmo, which indicates a large body of rich ore. Interest in the Slocan is steadily reviving, seventy men are busy at the Vancouver at Silverton. The Hewitt of Silverton will be on the shipping list once more, while reports from the Mollie Hughes at New Denver are decidedly good. Twenty men are at work on the famous Payne mine at Sandon, and many mining properties are being worked. Miners are hard to get and are wanted all over the district.

Ore shipments for the week are up to the best average for the year, and a further increase may be expected next month. The Consolidated Smelter at Trail received 11,000 tons this week, a record for the year.

## YUKON.

**Dawson, July 31.**—Klondike never saw such activity in its quartz properties as to-day. The quartz recording office has been so crowded of late with applications, renewals, and the like, that an extra clerk has been put on to assist Bert Brown, the quartz recorder.

Last month 110 quartz claims were located, and this month nearly 150 have been applied for to date.

Each quartz claim is 1,500 feet square. Taking this area 150 times, one will see that the quartz properties located during the present month will cover an immense area.

One point about the quartz activity is that the new staking is not confined to any one locality. The boom is on in every part of the district from Twelve-Mile to Sixty-Mile, from the high ridge dividing the camp to points along the Yukon; from Dawson to White Horse; in fact, everywhere throughout the territory.

While the quartz locations are going on, the owners of promising quartz also are spending not a little in development. The Davison people are pushing their large tunnel with the big hydro-electrical plant on the Dome and the Lone Star properties soon will have their stamp mill at work. A number of others are talking of putting in small stamp mills, and some are convinced that they can make their expenses out of their rock with a stamp mill right from the start.

# MINING NEWS OF THE WORLD.

## GREAT BRITAIN.

The wages dispute in the Scottish coal trade was settled on July 31st.

The following are some of the terms of settlement:

A minimum wage of 6s has been conceded to the miners.

An agreement has been made for three years.

The amount of the equivalent of the minimum is to be referred to arbitration.

The amount of advances by steps is also to be arbitrated upon.

The masters, it will be remembered, asked for a reduction in wages of 6d per day, making them 5s 6d per day. This led to the dispute now happily ended.

### Text of the Agreement.

1. The Conciliation Board shall be continued with the provision that there shall be obligatory a neutral chairman (whose decision in cases of difference shall be final and binding), to be selected by such method as shall be mutually agreed upon by the parties, and, failing agreement, by the Speaker of the House of Commons, and the Board and this agreement shall remain in force until the 1st of August, 1912; and unless six months before that date notice of termination is given by either party, it shall remain in force thereafter subject to six months' notice of termination given by either party at any time.

2. The principle of the 50 per cent. on 1888 basis as a minimum wage is conceded, and wages shall not be reduced below that point. In respect of the concession of an immediate 50 per cent. minimum, it is agreed:

(a) That the basis price for the 50 per cent minimum and the subsequent steps shall be referred to an arbiter. The reference to the arbiter shall be adjusted by parties and shall be on the footing that the relation between prices and wages in the past is recognized as equitable for the purposes of this arbitration and that the new basis price shall not be below the recent basis price—namely, 7s 5.45d. In fixing the new basis price and steps, consideration is to be given to the effect which the granting of an increased minimum wage would have on the re-

lation between prices and wages and also any other new circumstances bearing on increased or decreased costs since the agreement of 1904 was entered into which the arbiter considers relevant.

(b) That if for any month or months during the period from the date of this agreement to 31st March, 1910, the ascertained prices do not warrant a 50 per cent. wage under this memorandum, then for a like number of months any increased percentage in wages accruing under the memorandum shall be diminished by six and a quarter.

3. The neutral chairman, in giving his decision as to alterations in the rate of wages, shall take into account the state and prospects of trade.

4. Any difference regarding the interpretation of this memorandum or any difference regarding the terms of reference under clause 2 hereof, shall be referred to the decision of a neutral chairman to be mutually appointed by the parties, or, failing agreement, by the Speaker of the House of Commons.

5. The arbiter to act under clause 2 hereof shall be mutually appointed by the parties, and, failing agreement, by the Speaker of the House of Commons.

An interesting case occurred recently at Castleford Police Court, when 25 workmen of the Glasshoughton Colliery Company claimed damages from the company for breach of contract by refusing to allow the plaintiffs to descend the pit. An agreement had been signed by the colliery company that in the event of a pit gate meeting being held the men would be allowed an extra half-hour to get their lamps and descend on 28th June. The men contended that the agreement had not been carried out. The colliery company were ordered to pay 7s 6d each damages and the court costs in each case.

## SOUTH AFRICA.

The new 100-stamp mill being erected by the Roodepoort United will consist of stamps weighing 1,901 lbs., which will be the heaviest stamps so far put down on the Rand. The record capacity is at present held by the Cinderella Deep, which in May

crushed 9.17 tons per stamp per day with stamps of 1,650 lbs. Other innovations in the Roodepoort United plant are that five tube mills, or one tube mill for every 20 stamps, are to be installed; shaking tables are to be substituted for plates and the cyanide plant is to be of more than the usual capacity to secure low value residues. The capacity per stamp per day is estimated in excess of 12 tons, or approximately 36,000 tons per month, but in view of the results obtained from the Cinderella Deep mill the cyanide plant will be designed for an even greater quantity of tailings and slimes—namely 40,000 tons per month. A substantial reduction in present milling and cyaniding costs is expected. The new plant should be running in about May next.

#### WEST AFRICA.

Mr. W. A. Pritchard a rubber planter, has reported to the Government his discovery of a banket formation in the Birrim district, Akim, 100 miles behind Accra, extending over a large area.

It is understood that a Government expert has visited the district, the precise locality of which is kept secret, and that the reef is similar to the Tarquah formation.

The news is regarded in Government circles as of great importance and likely to accelerate the extension of the Accra-Akwapim Railway towards Kumassi.

The line is making steady progress and is expected to have trains running as far as Nsawam—28 miles—by October this year

#### UNITED STATES.

Within a month a hearing will begin in Seattle, Wash., that Denver Government officials assert will disclose proof of gigantic frauds in connection with coal lands in Alaska. The facts pointing to alleged frauds are known to Secretary Ballinger, of the U. S. Department of the Interior, and Fred. Bennett, Commissioner of the General Land Office. That more than 200,000 acres of rich coal lands in Alaska, some of them having veins 65

feet in thickness have been filed upon by dummy entrymen, procured through agents of six large corporations, the land office has evidence to prove, according to information made public.

The view of the General Land Office Commissioner Bennett, as given out, is that all entries found to be fraudulent should be canceled at once.

One of the coal companies involved in the alleged fraud is located in Seattle, another in New York, and still others in San Francisco, Omaha, and Chicago. The so-called dummy entrymen were recruited principally from the docks of Seattle, the mine of Butte, and the laboring classes of Chicago.

## Company Notes.

#### NEW DOMINION COPPER.

The last payment of the underwriters of the Dominion Copper Co. was made last Friday and the securities of the new company delivered to what now constitutes the present bond and shareholders, the old bondholders having received bonds and stock to which they were entitled.

The new company now has outstanding \$500,000 of bonds and 250,000 shares of stock. By the purchase of the old bonds, which have been exchanged for stock in the new company, and also by purchase of stock in the new company that has been delivered to the underwriters, the British Columbia Copper Co. interests are now large shareholders in this company.

An interim dividend of 1s per share has been declared by Bell's Asbestos Company, Ltd. The dividend was last raised in 1906 from 12 1-2 per cent. to 15 per cent. This latter rate has been maintained since then. The company has accumulated a reserve of £65,000 invested in high-class securities outside the business. Of this amount £50,000 is allocated to a special reserve fund for the equalization of future dividends. The carry-forward has gradually risen from £9,480 in 1906 to £15,266 in 1908.

## STATISTICS AND RETURNS.

#### STATISTICS AND RETURNS.

L. Vogelstein and Co. report the following figures of German consumption of foreign copper for the months January to June, 1909:

|                             |             |
|-----------------------------|-------------|
| Imports of copper .....     | 80,061 tons |
| Exports of Copper .....     | 3,913 "     |
| Consumption of copper ..... | 76,148 "    |

as compared with consumption during the same period in 1908 of 79,090 tons.

Of the above quantity 73,416 tons were imported from the United States.

#### COBALT ORE SHIPMENTS.

Following are the shipments from Cobalt for the week ending Aug. 14, and those from Jan. 1, 1909, to date:—

|                        | Week ending<br>Aug. 14. | Since<br>Jan 1. |
|------------------------|-------------------------|-----------------|
| Ore in lbs.            | Ore in lbs.             |                 |
| Buffalo .....          | 748,678                 |                 |
| Chambers-Ferland ..... | 961,010                 |                 |
| City of Cobalt .....   | 64,000                  | 1,002,522       |
| Cobalt Central .....   | 41,670                  | 519,474         |
| Cobalt Lake .....      |                         | 79,960          |

|                                |           |
|--------------------------------|-----------|
| Coniagas .....                 | 1,043,315 |
| Crown Reserve .....            | 182,800   |
| Drummond .....                 | 920,000   |
| Kerr Lake .....                | 1,298,146 |
| King Edward .....              | 183,740   |
| La Rose .....                  | 258,190   |
| McKinley-Darragh .....         | 122,350   |
| Nipissing .....                | 322,390   |
| Nova Scotia .....              | 480,810   |
| Nancy Helen .....              | 83,400    |
| Peterson Lake .....            | 40,000    |
| O'Brien .....                  | 1,565,742 |
| Right of Way .....             | 2,032,691 |
| Silver Queen .....             | 167,350   |
| Silver Cliff .....             | 123,820   |
| Temiskaming .....              | 1,446,060 |
| Trethewey .....                | 1,296,698 |
| Temiskaming & Hudson Bay ..... | 1,106,260 |
| Muggley Cons. ....             | 72,900    |

Ore shipments to Aug. 14, 1909, from Jan. 1, are 37,315,252 pounds, or 18,657 tons.

Total shipments for week ending August 14, 1909, are 1,198,750 pounds, or 599 tons.

**COBALT ORE SHIPMENTS.**

Following are the shipments from Cobalt for the week ending Aug. 21, and those from Jan. 1, 1909, to date:—

|                                    | Week ending<br>Aug. 21. | Since<br>Jan. 1. |
|------------------------------------|-------------------------|------------------|
|                                    | Ore in lbs.             | Ore in lbs.      |
| Buffalo . . . . .                  | 42,350                  | 791,028          |
| Chambers-Ferland . . . . .         | .....                   | 961,010          |
| City of Cobalt . . . . .           | .....                   | 1,002,522        |
| Cobalt Central . . . . .           | 39,310                  | 558,784          |

| Crown Reserve . . . . .            | 187,840                 | 4,043,315        |
| Drummond . . . . .                 | .....                   | 920,000          |
| Kerr Lake . . . . .                | 123,880                 | 1,422,026        |
| King Edward . . . . .              | .....                   | 183,740          |
| La Rose . . . . .                  | 206,600                 | 8,181,213        |
| McKinley-Darragh . . . . .         | .....                   | 1,237,556        |
| Nipissing . . . . .                | 190,120                 | 9,577,593        |
| Nova Scotia . . . . .              | .....                   | 480,810          |
| Nancy Helen . . . . .              | .....                   | 83,400           |
| Peterson Lake . . . . .            | .....                   | 281,110          |
| O'Brien . . . . .                  | 64,020                  | 1,629,762        |
| Right of Way . . . . .             | 61,990                  | 2,094,681        |
| Silver Queen . . . . .             | .....                   | 598,395          |
| Silver Cliff . . . . .             | .....                   | 123,820          |
| Temiskaming . . . . .              | 60,000                  | 1,506,060        |
| Trethewey . . . . .                | .....                   | 1,296,698        |
| Temiskaming & Hudson Bay . . . . . | .....                   | 1,106,260        |
| Muggley Cons. . . . .              | .....                   | 72,900           |

Ore shipments to Aug. 21, 1909, from Jan. 1, are 38,291,362 pounds, or 19,145 tons.

Total shipments for week ending Aug. 21, 1909, are 976,110 pounds, or 488 tons.

**B. C. ORE SHIPMENTS.**

The re-entry of the B. C. Copper Company into the shipping list was one feature of the week, the Mother Lode sending 2,730 tons to the Greenwood Smelter. The appended are the ore shipments and smelter receipts in detail:

| Boundary—             | Week.  | Year.     |

## PRINCIPLES OF MINING

By H. C. HOOVER, E. M. 200 pages, 6x9, fully illustrated, \$2.50 (10/6).

### Valuation—Organization—Administration

An important book on underlying principles.

Part I covers fully the determination of value, prospective and in sight—the sizing up of the mine. Part II discusses the development and organization—tunnels, shafts, crosscuts, etc., with chapters on mechanical equipment and efficiency. Part III takes up the problem of administration—later efficiency, unions, wages, working costs, accounts, division of expenditure, etc.

## Mining Methods in Europe

By L. W. MAYER, E. M. 170 pages, 6x9, fully illustrated, \$2.50 (10/6).

Based on Mr. Mayer's report to a large American holding Company on methods employed in Europe. He found a great deal that will make for larger and more economical extraction in American practice.

Points covered: caving system, longwall in England and France, robbing high pillars and various others.

## UNDERGROUND SURVEYING

By LOYAL W. TRUMBULL,  
E. M.

250 pages, 6x9, illustrated, \$3 00  
(12/6.)

The first work based on American Practice. Prepared with the assistance of leading American engineers. Contents cover Instruments, Meridian, Underground Practice, Carrying Meridian Underground, Secondary Openings, Records, Maps, Bore-hole Surveys, etc.

# BOOKS ON MINING

### All Prices Net and Postpaid

**GUARANTEE:** When cash accompanies an order the purchaser may, within five days of receipt, return any or all of these books and his money will be refunded promptly.

## MINE TIMBERING

By SANDERS, PARLEE, Mac-  
DONALD and OTHERS

176 pages 6x9, illustrated, \$2.00  
(8/6).

A series of practical papers, covering thoroughly the difficult problems of timbering. Some of the subjects treated are: Stoping, Dry Walling, Square Sets, Roof Supports, Framing, Arch Centers, Cribs, Tools and Machinery.

## Mining, Mineral and Geological Law

By CHARLES H. SHAMEL. Over 600 pages, 6x9, illustrated, \$5.00 (21s.).

Full and complete treatment for mining lawyers and engineers. The underlying principles, common law, definitions and discussions of decisions. Includes full text of U. S. and the State Statutes and the rules governing public lands.

## Economics of Mining

Edited by T. A. RICKARD  
421 pages, 6x9, \$2.00 (8/6).

The following sub-titles of the book will indicate its value: Gold Mine Accounts; The Cost of Mining; The Valuation of Mines; Mine Equipment in Relation to Ore Reserves, and a discussion besides of the special classes of mining at various important centers. In each case an expert has been chosen for the work.

## Simple Mine Accounting

By DAVID WALLACE.  
64 pages, with bookkeeping forms, \$1.00 (4/6.)

A compact and extremely simple system for small mines. Mr. Wallace is an expert accountant.

## Elements of Mining and Quarrying

By SIR C. LeNEVE FOSTER

5x7½, cloth, \$2.50.

A Treatise for Beginners

General contents: Occurrence, Discovery, Boring, Excavations, Explosives, Support, Timbering, Exploitation, Haulage, Hoisting or Winding, Drainage, Ventilation, Lighting, Access, Dressing, Legislation, Condition of the Workmen, Accidents.

## Report Book for Mining Engineers

By A. G. CHARLETON

Pocket size, new edition, \$2.50

Instructions and forms for mining engineers. Full of useful data.

**Book Dept. Canadian Mining Journal**  
**Confederation Life Bldg., Toronto**

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## TIMBERING AND MINING

By W. H. STORMS

**W**E regard this as the best book on practical mining methods that has ever been offered. It has nothing to do with the theory, but is a straightforward account of the best methods employed under various conditions at the leading American mines.

It deals with the kind of timber to be used, timber preservation, structural steel, and all other phases of timbering.

It deals as well with shaft sinking, bucket dumping, head frames, etc., etc.

It is a complete book of practical value, and sold subject to our absolute guarantee. 270 pages, 6x9, fully illustrated. \$2.00 net postpaid.

**GUARANTEE**—When cash accompanies an order for a book, the purchaser may, within five days of receipt of the books, return any or all of his purchase, for any reason whatsoever, and his money will be refunded immediately.

**Book Dept. Canadian Mining Journal**  
Confederation Life Bldg., Toronto

# Geological Survey

## PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada and with many local areas and special subjects

### MARITIME PROVINCES

The whole of Cape Breton and a large portion of the coal and gold fields of Nova Scotia have been reported upon and mapped on a scale of 1 mile to 1 inch. The remaining portions of the province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter provinces, mapped on a scale of 4 miles to 1 inch.

### QUEBEC

Quebec, south of the St. Lawrence, has been reported upon and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the province north of the St. Lawrence are also available.

### ONTARIO

A large part of the province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

### THE PRAIRIE PROVINCES

Geological maps and reports have been issued covering the greater part of the provinces of Manitoba, Saskatchewan and Alberta.

### BRITISH COLUMBIA

The southern portions of British Columbia, as well as other parts of the province, have been reported upon and mapped.

### YUKON

Many of the important areas in the Yukon have been reported upon and mapped.

### THE NORTH-WEST TERRITORIES

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to *THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

### THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:

#### NOVA SCOTIA

1019 City of Halifax Sheet.

1025. Waverley Sheet.

The above two sheets belong to the regular series of Nova Scotia map sheets on a scale of one mile to one inch. The first includes Halifax City and Harbour, the second the Waverley Gold District.

#### ONTARIO

1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

#### BRITISH COLUMBIA

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shews the geology and location of veins.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch, by W. H. Boyd.

NOTE.—Maps recently published may be had on linen cloth for use in the field at the price of 10c. per copy.

#### REPORTS

1072. Summary Report of the Operations of the Geological Survey for year 1908.

The Geological Survey, under certain limitations, will give information and advice upon subjects relating to general and economic geology. Mineral specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to *THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

# Ontario's Mining Lands

---

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite ; copper in sulphide and native form ; gold, mostly in free milling quartz ; silver, native and in other forms ; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries  
Quebec.**

## Province of Nova Scotia

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver; \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,300, the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

Fernie, British Columbia**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

**BARROW HAEMATITE STEEL CO., BARROW-IN-FURNESS, ENGLAND**

Quotations for Tee Rails, Fish Plates, etc., promptly furnished. Catalogues sent on application.

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

**General Passenger Department, Intercolonial Railway**  
**MONCTON, N.B.**

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

## Canadian Westinghouse Co., Limited

General Office and Works, HAMILTON, ONTARIO.

Traders Bank Bldg.,  
TORONTO.  
439 Pender Street,  
VANCOUVER.

Address nearest office:  
HAMILTON.

## HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT TORONTO KENORA WINNIPEG, MAN.  
VICTORIA, B.C. VANCOUVER, B.C. CALGARY. ALTA. NELSON, B.C.

Three Post Magneto Electric Blasting Machine

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

## The "Little Hardy" Coal Cutter

Holes at Floor Level or Roof Level or in any intermediate position in Coal or Dirt Band, &c.

Equally suitable for Holing and Shearing.

The Lightest Coal Cutter in the Market.

Nearly 700 Machines at work. 93 in use by one Canadian Company.

## The Hardy Simplex Hammer Drill

Weight 22 lbs. Bores 6 ft. Deep.

Automatically Rotates the Drill Steel and lows out the Cuttings  
FOR SINKING, &c.

**SOLE MAKERS**

**The Hardy Patent Pick Co., Limited**  
SHEFFIELD, ENGLAND

Stocks of these machines kept by Messrs. A. C. Thompson  
Co., Limited, North Sydney, Nova Scotia, Canada.

THERE ARE OTHERS, BUT WE KNOW

## "Cleveland" Stoping Drills

Will give you the best results of all. If you are skeptical, give us shipping directions, and we will send you one on 30 days' trial, so you can

## Find Out What They Will Do

in your own mine,—or better still, buy one machine and keep a record of amount of Drilling, time laid up for repairs and cost of repairs, (if any) and then compare these records with similar ones kept of any other stoper. If you will do this, we feel sure that when you are ready to order more equipments

## We Will Get Your Order

Bulletin 40-A with full information mailed on request.

**Amatite**  
B  
**ROOFING**

**No more paint for me!  
I've now covered every roof  
on my place with Amatite.**

**T**O buy a roofing that requires painting is inviting trouble. Painted roofings are as out of date as the harvester machinery of thirty years ago.

The roofing of to-day needs no painting. That's one of its great features.

If you are still using the "old rubber kind," the kind that requires painting every year or two to keep it tight, we want to tell you about Amatite; why it *needs no painting*; why it *wears longer* than the "smooth surfaced" roofings, and why it *costs less*.

*First*—Its chief ingredient is Coal Tar Pitch—not a "secret compound" but a well known, long tested material, recognized by engineers as the greatest waterproofing material known. *Two layers* of this material are used in every sheet of Amatite.

*Second*—We use two layers of the best grade of wool felt to hold the pitch in place. This wool felt gives tensile strength to the roofing, and is the best material known for that purpose.

*Third*—On top of these four layers is a *real mineral surface*. This surface requires absolutely no painting, and adds materially to the life of the roofing. It is fire retardant. It is permanent.

**FREE SAMPLE**

We want to send you a sample so that you can see what a solid, substantial waterproof roofing Amatite really is. Write to-day. Address nearest office.

### WESTERN COAL.

Canada is entering upon a new phase of extension. That reciprocity in coal between the United States and the Dominion is a live question, is merely one indication of the growing strength of our country. That it has been discussed at all is due to several causes, principally to the fact that Alberta and British Columbia have practically a monopoly of high-grade coal in the west.

The rapid exploitation of our western coal areas is, therefore, a matter of national moment. And since coal-mining is not a poor man's game, a plentiful supply of capital is a pre-essential. Also, for the good of all concerned, it is desirable that initial mistakes be avoided. Coal is, more or less, a public utility. The ownership of the western deposits is vested in the Canadian public, and it is appropriate that the Canadian public should follow intelligently the steps that are being taken to open up some of the most important fields in Alberta.

The latest and perhaps the most significant happening in Albertan coalfields is the amalgamation of the interests of the German Development Company with those of the Canadian Northern Railway. This is an event that will have far-reaching effects. A glance over the railway map will be sufficient to justify the assertion that this alliance gives the Canadian Northern a most advantageous position. Possibly it brings in their hands the control of a considerable proportion of the bituminous coal supply available for railway use in Alberta.

The amalgamated interests are represented by two recently incorporated companies. "The Rocky Mountain Collieries, Limited," and "The Brazeau Collieries, Limited." The property of the first-named company is situated a few miles south of the main line of the C. P. R., where this line enters the Rockies, and where, up to now, the inadequate supply of steam coal shipped from Canmore had to be supplemented by fuel from Crow's Nest Pass. The coal lands controlled by "The Brazeau Collieries, Limited," comprise the areas belonging to the German Development Company, on the Brazeau, Bighorn, and Saskatchewan Rivers, along with the properties of Mackenzie and Mann on the Brazeau and McLeod Rivers.

Doubtless, the Brazeau lands will be worked for the particular benefit of the Canadian Northern Pacific. The coal here, according to the results of careful investigation, is a high-grade bituminous fuel. And it exists in vast quantity. The areas to be worked by "The Rocky Mountain Collieries, Limited," will become more valuable when the Mackenzie and Mann

line from Edmonton through Calgary to the Boundary country shall have been completed.

It is restful to observe that neither of the above concerns is to be put on the market as a public flotation. In both, foreign capital is heavily interested. Both, also, have been projected only after long investigation by and consultation with qualified coal-mining engineers, and geologists.

We are informed that both properties are to be opened up at once. Competent authorities have been engaged to advise upon means and methods, and early blunders, irreparable in the later life of a mine, are being sedulously avoided.

Whether success or failure attend the future history of this projects—and we have little reason to expect anything but success—they are bound to loom large in the commercial economy of the West. Especially interesting to Canadian coal mine operators will it be to watch the manner in which development proceeds.

### PUBLICITY.

Canadian newspapers have much to learn as regards the meaning and value of the mining industry. The great majority of our dailies either ignore the industry completely or publish sensational clap-trap.

Yet there is a growing number of newspaper men to whom mining means more than the stock market. We have noted before the enterprise of the British Columbian dailies. Several of these publish daily columns of mining news. The statistics of ore production appear in a number, and full publicity is given to mining concerns new and old. Naturally there is a fair sprinkling of unreliable news. This, apparently, is inevitable. But the total amount of such stuff appearing in B. C. papers is creditably small. One feature that is distinctly pleasing is the annual review that comes out promptly at the end of the year in several of the more progressive western journals. And it is by no means invidious to mention here the excellent work of Mr. E. Jacobs, of Victoria, secretary of the Western Branch of the Canadian Mining Institute, and a valued contributor to the leading mining journals of the Empire and the United States. Mr. Jacobs possesses a passion for accuracy and a fearlessness that have become almost proverbial. His contributions to the press have given his Province wide advertisement, and have demonstrated not only the value of accuracy and honesty in these matters but have shown the futility of exaggeration.

But, with few exceptions, eastern newspapers give little or no space to mining. Stock-gambling is encouraged. Inspired news-notes touting mining properties are rarely refused. Generally, the reading public learns nothing of what is being done in mining and smelting from the daily papers.

We have stated that there are exceptions. These are to be found, not in the larger cities, but at or near

mining centres. In Eastern Quebec one paper devotes regularly a fair proportion of its space to recording the doings at the mines within its field. In Western Ontario three or four journals do what they can to keep public interest alive. But in the Maritime Provinces only spoadie attempts are made in this direction.

Considering this condition, it is to be regretted that the Geological Survey of Canada no longer issues press bulletins. These could be made an invaluable medium of publicity. Moreover, the Boards of Trade in our mining towns are neglecting their opportunities. The publicity departments of our railroad organizations pay more attention to the sportsman than to the miner and prospector, although it is patent that a well-conducted campaign to advertise our untouched mineral lands, to direct and instruct the rising generation as regards the possibilities of the mining industry, would bring infinitely larger results in the long run.

We shall not cease to keep before our readers the issues touched upon above. But we must frankly deplore the indifference of the press and of the transportation corporations, and the inertness of other organized bodies. We have yet to develop a national spirit of co-operation.

### A CHANGE OF HEART.

Mr. Eugene Coste's recent paper dealing with the origin of petroleum has been the subject of much comment. Mr. Coste himself has received letters from a large number of prominent geologists and others. These letters afford the clearest evidence that modern geologists no longer think it a crime to question the theory of the organic origin of petroleum. Indeed there is ample indication of a change of heart on the part of not a few.

It has been our privilege to read a number of the letters received by Mr. Coste. A few quotations will show how the "inorganic" theory is gaining ground.

One officer of the United States Geological Survey writes thus: "While I am not prepared at this time to accept the universal application of this theory, especially in the Appalachian regions, I recognize that on a number of important points it has placed the burden of proof upon believers in the organic origin." This last assertion shows certainly that Mr. Coste has made progress.

In another letter a sidelight is thrown on the subject by the operator of a quicksilver mine in Oregon. "The deposit," he writes, "has been pronounced by geologists a distinct product of solfatoric action, and the very frequent occurrences and constant association of so much carbon would seem to bear out your very reasonable and logical theory of the volcanic origin of the petroleum series of hydrocarbon compounds."

Again, in a communication from another Survey official, the intimate association of oil with igneous bodies is mentioned. In this case the writer states that

he has collected several hundred instances of the association of oil with igneous rocks.

One territorial geologist makes a suggestion to the effect that volcanoes and explosive earthquakes have a direct connection with petroleum. "The immense volume of smoke emitted at times suggests the presence of volatile hydrocarbons, fluid or gaseous. . . . Explosive mixtures of air and gas may account for many earthquakes. I am inclined to the view that volcanoes are the results rather than the cause of petroleum. . . . We cannot exclude water and steam as active agents in vulcanism; but we must admit the powerful agency of explosive mixtures of gas and air."

A distinguished Mexican geologist alludes to the immense practical importance of a clear understanding of the "inorganic" theory in developing new fields. He heartily endorses Mr. Coste's position.

After reading more than a score of letters of this kind, one is led to believe that the tendency amongst our leading geologists is to accept more fully the theory of which Mr. Coste has been so ardent a supporter. This is a matter of no little importance, in view of the fact that the industrial world is becoming every day more dependent upon petroleum and its products. It bears directly upon the exploitation of our petroleum and gas fields.

Incidentally it must be most gratifying to Mr. Coste, who for some years has played a lone hand, to find that his supporters are becoming more numerous every day.

### MEXICAN INSTITUTE OF MINING AND METALLURGY.

Bulletin No. 1 of the Mexican Institute of Mining and Metallurgy (Instituto Mexicano De Minas Y Metalurgia) has just been received. It is a most commendable production.

Mexican cyanide practice has set a standard for the world. In the United States cyanidation is admittedly less advanced than in the southern republic, and, on the Rand, Mexican practice has been copied.

Hence it is with especial pleasure that we observe that two of the three papers included in Bulletin No. 1 treat of cyanidation. The first of these two, "A Proposed New System for the Cyanide Treatment of Slimes," is reprinted in this issue of the Canadian Mining Journal. The second, "Cyanidation of Concentrates," is a suggestive synopsis of a paper by A. Goothe.

The proceedings and papers are printed both in Spanish and English. This duplication of languages should be highly educative. The Canadian mining student must acquire a knowledge of Spanish if he is to become a well-rounded mining man. The Bulletin of the Mexican Institute will prove an invaluable aid in this.

The Canadian Mining Journal wishes the newly organized society a vigorous and prosperous life. Its

objects are wholesome. It has made a good start.

We may express here the hope that close relations may be established between the Canadian Mining Institute and its sister society. Prosit!

### SILVER COINAGE.

Throughout Canada the silver coins of the United States are accepted at par. On the other hand, except in towns near the international boundary, Canadian coins are either refused in the United States or accepted at a large discount.

There is a Canadian law providing for the deportation of United States coins. Apparently this law is inoperative. Why it should be, we do not know. But it is obvious that until this is made effective, the Royal Mint at Ottawa cannot make headway. The seignorage on coining silver is large, because of the disparity between the face value of silver coins and their actual worth as silver. With a large output of silver coins, the Royal Mint would pay handsomely. There appears to be little reason why our whole demand should not be supplied from Ottawa. It is certain that with a sufficient Canadian coinage much of the United States silver now in circulation here would be displaced.

### EDITORIAL NOTES.

The sixth general meeting of members of the Western branch of the Canadian Mining Institute was opened at Nelson, B.C., on September 25. The Council of the Branch, having accepted the invitation of the American Institute of Mining Engineers to adjourn to Spokane, will join that body's discussion and proceedings there.

The Sheep Creek gold camp, a few miles east of Rossland, is giving promise of wealth. The camp is yet in its infancy. But substantial working profits have been made in small stamp-mill operations, and there is sound reason to cherish the expectation that Sheep Creek will have a prosperous life. Transportation of ore will be facilitated by the construction of a Government bridge across the Columbia River at Rock Creek. It is possible, also, that electric power will be furnished within a reasonable time.

The flow of European capital to Alberta and British Columbia is heavy. Heavy investments in coal and timber lands are the order of the day. Heretofore United States capital has preponderated in new investments. Now, however, British, French, and German investors are most active. Two or three late mining transactions can be traced directly to interest aroused by the excursion of the Canadian Mining Institute last year.

# A PROPOSED NEW SYSTEM FOR THE CYANIDE TREATMENT OF SLIMES.

By Ferdinand McCann, Mexico, D.F.

(From the bulletin of the Mexican Institute of Mining and Metallurgy.)

(July Meeting, 1909.)

Having lately visited various cyanide plants in the Republic while gathering data for the book which I have just published on the subject, I was greatly interested by the almost perfect settlement of slimes performed by the Dorr Continuous Slime Thickener installed at the San Rafael Mill in Pachuca, and it occurred to me that by extending the field in which this apparatus is at present employed, an entirely new system of cyanide treatment of slimes might be devised.

The elaboration of this idea has resulted in the following proposal of a system which I will call be Dilution System, in contra-distinction to the Decantation System of Slime treatment. This system consists in the establishment of a series of slime thickeners, following the agitation tanks, with a dilution of the thickened pulp as it enters each successive thickener.

The apparatus which I would recommend for the purpose is the Dorr Continuous Slime Thickener, or any apparatus acting on the same principle, not only on account of its marked superiority over cones and spitzkasten as a settler, but also on account of the fact that the tanks and agitating apparatus used in the present installations of mechanical agitation in flat bottom tanks, could by very slight modifications be used as thickener tanks, so that the cost of the conversion of a decantation plant into a Dilution plant would be small.

The advantages which I believe may be obtained by this new treatment over the decantation treatment are:

A. Less cost of installation, as less tanks are required.

B. Less time required in the treatment, with a consequent increased capacity for a plant already installed.

C. Less labor, as the manipulation of the decantation pipes is entirely eliminated.

D. Less values in the solution that is discharged with the tailings, with consequent increased extraction.

E. The same bulk of solution to be precipitated.

The advantages which may be obtained by this installation in connection with a plant, practising mechanical agitation in flat bottom tanks, with semi-decantation and filtering, comprise those mentioned under headings A, B, C and D, and in addition, there would be:

F. Greater capacity and efficiency for the filtering plant.

The disadvantages in such a plant would be that:

G. A greater bulk of solution would have to be precipitated.

The advantages and disadvantages with plants using "Pachuca" tanks would be those mentioned under headings D, F and G.

## Method of Working the Dilution System.

In order to explain the working of this system let us assume that we have an ore assaying 500 grams of silver per ton, which has been slimed in the ordinary manner and introduced into an agitation tank in proportion of 50 tons dry slimes to 150 tons of solution con-

taining 0.3 per cent. KCy, and that the pulp thus formed is agitated continuously for 48 hours. We can assume, according to results obtained in Pachuca by continuous agitation, that at the end of that time, a washed and dried sample of the slimes will assay 70 grams of silver per ton, so that the 150 tons of solution will contain 21,500 grams of silver dissolved from the ore, or 143 grams per ton of solution.

By passing this pulp through a Dorr Thickener we will obtain a thickened pulp containing 55 per cent. of moisture. Therefore we will have:

(1) An overflow of 89 tons of clear solution assaying 143 grams of silver per ton, and 0.3 per cent. KCy; and

(2) 111 tons of thickened pulp, containing 61 tons of the same solution.

By mixing this thick pulp, thoroughly, with 549 tons of barren solution; i.e. 9 tons of barren solution for every ton of rich solution contained in the thickened pulp; we obtain, as a charge for the second Dorr Thickener, a dilute pulp composed of 50 tons of dry slimes, mixed with 610 tons of solution assaying 14.3 grams of silver per ton.

From this second Dorr Thickener we obtain:

(3) An overflow of 549 tons of clear solution assaying 14.3 grams of silver per ton and 0.3 per cent. KCy; and

(4) 111 tons of thickened pulp, containing 61 tons of the same solution.

By mixing this thickened pulp with 549 tons of water and passing it through a third Dorr Thickener, we have:

(5) An overflow of 549 tons of clear weak solution assaying 1.43 grams of silver per ton and 0.03 per cent. KCy; and

(6) 111 tons of thickened pulp, which as it contains but 61 tons of solution assaying 1.43 grams of silver and 0.03 per cent. KCy, may be thrown away, as it will not pay to extract the values in solution by further handling.

The preceding statements regarding the cyanide contents in the various solutions does not refer to free cyanide, as of course a certain amount will have combined with the silver, etc.

The only precaution required in this treatment is that, in each dilution, there should be a perfect mixture of the thickened pulp with the diluent, as otherwise the dilution would be imperfect, and the thick pulp, in falling to the bottom of the successive thickener tanks, might carry undiluted solution enclosed within its mass.

This mixture might be performed by a centrifugal pump, receiving both pulp and diluent, and throwing them together into a bucket or other small receptacle, which would not only act as a mixing apparatus, but also enable the diluted pulp to overflow without much current into the successive Dorr Thickener.

### Treatment of the Solutions.

The solution (1) should be precipitated, while solution (3) might be partially precipitated, and partially used in the battery, collection—and agitation tanks. But as each 50 tons of ore require 549 tons of precipitated solution for dilution in the second Dorr Thickener, we can assume that we would have to precipitate 11 tons of solution per ton of ore treated. This is about the amount of solution precipitated in the decantation plants of the El Oro Mining and Railway Co., and the Dos Estrellas Company, before the installation of the filters, so that in this respect there is no difference between the two systems.

The question naturally arises as to what is to be done with the solution (5); as, if fresh water were used in each dilution, the bulk of solution in the mill would soon be too great to handle, and if the solution (5) were used over again, as a diluent to the treatment of the successive charge, it would assay 2.71 grams of silver and 0.057 per cent. KCy; after its third use it would assay 3.82 grams of silver and 0.081 per cent. KCy, etc.

This weak solution, after being used once or twice as a diluent, might be used in the battery and collecting tanks, and then its values could be precipitated before being used again as a diluent, in which way the silver values could be kept within reasonable bounds but the cyanide values creep up until equal to those of the strongest solution in use in the mill, which, with a 0.3 per cent. solution, would mean that with each ton of tailings discharged there would be a loss of 1.22 tons of solution containing 3.66 kilos of cyanide, thus making the cost of treatment rather high.

However by using a weak solution of cyanide throughout the mill, say 0.05 per cent. KCy, as is at present done in mills using the decantation process with filter attachment, the loss by this dilution treatment would be within commercial bounds, and would be much less than that sustained under the decantation treatment.

In case this practice were followed, the precipitated barren solution should only be used in dilution of the thick pulp entering into the second Dorr Thickener and the direction of pulp entering into the second Dorr thickener should be performed by adding solution (5) which overflows from the third thickener, so that the quantity of solution to be precipitated would remain more or less constant, in the quantity of 11 tons of solution per ton of ore treated.

### Application of the Process in Connection With a Filter Plant.

When the dilution system is installed in connection with a filter plant the third Dorr Thickener could be dispensed with, and the thickened pulp (4) from the second Dorr could be run direct to the filters, where, after filtering, it could be washed with the small quantity of water required to replace that discharged with the tailings, so to keep the bulk of the mill solution constant, as is at present done in practice.

The advantages of installing this system in connection with a filter plant would be that, on account of the pulp being thick, the cake would be formed on the filter leaves in less time, consequently increasing the capacity of the present filter plant installation; and also, that the values in the solution accompanying the pulp to the filter would be much less than those ordinarily contained, so that the losses which might occur through imperfect washing of the cake would be diminished.

This latter feature is of especial importance in installations where the ore is treated in "Pachuca" tanks, as in such installations the solutions which are filtered assay from 100 to 300 grams of silver per ton, according to the value of the ore treated, and consequently it is customary to wash the cake on the filter, first with barren solution, and afterwards with water; but even with this double washing the displacement of the rich solution is not perfect, as is evidenced by the fact that the tailings discharged from the filter sometimes carry solution assaying from 8 to 20 grams of silver per ton; so that at present the practice of collecting the wash water in dams, and reprecipitating is giving good results.

By the application of the diluting system, before filtering, the solution which is contained in the pulp delivered to the filter would be of such a low grade that the wash with barren solution in the filter might be unnecessary, as a simple water wash would probably extract all of the values in solution, so that the time occupied in filtering could be reduced one-third, with a resulting increase in the capacity of the present filter installation.

### Plant Required.

It is customary, in the decantation treatment of slimes, to consider that a tank 30 feet in diameter and 10 feet high is necessary for treating 50 tons of ore with 150 tons of solution, as if the pulp is thicker than 1 to 3 there will be very little settling and decantation, so that in modern installations for slime treatment by partial decantation and filtering counting on 4 days' treatment in the tanks, there are required from 24 to 27 tanks of this size for treating 300 tons of ore per day.

By the dilution system, as there is no decanting in the treatment tank, there would be no reason to prevent charging 100 tons of slimed ore with 140 tons of solution to each tank. Furthermore as the same extraction is obtained in 48 hours by continuous agitation as in 96 hours by the decanting and settling treatment, the tank capacity for a plant treating 300 tons of ore per day by the dilution system would be as follows:

3 Dorr Thickeners, or agitating tanks used as settlers to dewater the pulp from the batteries.

7 Agitating tanks, being one extra for the time lost in filling and emptying.

3 Dorr Thickeners for the first dilution.

3 Dorr Thickeners for the second dilution.

Making a total of 16 tanks, as against 24 to 27 for the same purpose in the partial decantation and filtering plant of the same capacity.

In the older decantation plants, which have no filters, the tank equipment required is much greater than that of the partial decantation and filtering plants above mentioned, as in addition to the agitation plant therein described, there is generally a system of final settling tanks, where the slimes remain for another, three or four days, so that there may be required from 20 to 30 more tanks of the same size for that purpose.

These settling tanks would be entirely replaced in the dilution system, by the installation of 3 Dorr Thickeners, for the third dilution, as the capacity of a 30 foot Dorr Thickener is about 100 tons of ore, contained in 222 tons of thickened slimes, and about 1,000 tons of clear solution overflow per day.

### Regulating the Quantity of Diluent.

It may appear that the regulation of the exact amount of diluent to be supplied to each thickener

would be a matter requiring extreme care and attention, but I believe that this would not be the case, as the only result of a slight variation would be that the solutions in the successive thickeners would carry more or less values, which could be regulated by the daily assays.

The Dorr Thickener works automatically, with very little attention, and would handle sudden changes without any trouble.

An easy way for the workman to judge whether the proper quantity of diluent were being added, would be for him to have two cans of different sizes, which he could place under the streams of thickened pulp and diluent passing into the centrifugal pump, to observe whether the cans were filled in the same time, and if not he could so regulate the valve of the diluent pipe that the time required to fill each can would be the same.

Assuming the specific gravity of the ore to be 2.7, that of the diluent to be 1.03 and the thickened pulp to contain 55 per cent. of moisture, the relative size of the cans required for a dilution of 9 of diluent to 1 of solution contained in the thickened pulp would be in the proportion of 6.87 to 1.

#### Intermittent Working of the System.

By the ordinary working of the dilution system, as soon as the assays have shown the extraction in any

tank to be satisfactory the pulp contained in that tank could be transferred to the first Dorr Thickener, by means of a centrifugal pump, leaving the tank to be emptied ready for the next charge.

But should it be desired, the plant might be arranged for the

#### Continuous Working of the System.

This arrangement like that of the "Boss" continuous amalgamation process, might have some advantages, and may be worth investigating. However it would probably need some special arrangement for transferring the pulp uniformly throughout the agitation tanks.

#### Conclusion.

I wish to state that my interest in the Dorr Thickener is purely a scientific one, and I would further state that I do not propose this system as one which has been proven, nor would I advise its installation without having proven it by a preliminary trial on a small scale.

I merely offer it as a suggestion to the various metallurgists practising cyanide treatment, in the hope that the application of the principles herein proposed may be of benefit to them in their work, and that I may be instrumental, to a slight extent, in the improvement of the present metallurgical practice.

## IRON ORE DEPOSITS OF NOVA SCOTIA.

Notes from Reports by Dr. J. E. Woodman, issued by the Mines Branch,  
Department of Mines Ottawa.

(Continued from issue of August 15th.)

Magnetite, hematite, limonite (or brown hematite), ankerite, and siderite are found in Nova Scotia, as are also the less common iron-bearing minerals, turgite, goethite, and sideroplesite.

**Magnetite.**—The Triassic trap magnetites of the province vary in iron contents from 68.33 per cent. to 35.25 per cent., an average of ten samples giving 55.13 per cent. They often contain some specular hematite. The altered hematites of the Nictaux-Torbrook and Clementsport basins, while highly magnetic, usually have a brownish or reddish streak. They should be classed for the most part with the Clinton red hematites; but such as have been sufficiently metamorphosed, like those of South Mountain, are true magnetites. An average of these western occurrences shows 42.32 per cent. iron. The pre-Cambrian magnetites of Cape Breton vary widely.

Magnetite in the Triassic trap is at times well crystallized in gas and gash cavities, and in most of the deposits it is coarsely granular to massive.

**Hematite.**—In Nova Scotia no high-grade specular deposits have yet been sufficiently explored to prove that they are of workable size. Such analyses as can be given are sample assays from veins only, or are from districts outside the scope of this report. The chief exception is the Barachois specular ore, small lots of which run to 66.66 per cent. The specular ores of Londonderry are in a class by themselves, in that they have a highly micaceous structure, but most often show a brown to brownish red streak, due to the percentage of

moisture. So far as can be determined, these ores contain, on an average, 67.44 per cent. iron.

The Clinton red ores in Nova Scotia are, next to the mixed ores of Londonderry, the most important. The typical Clinton ore in New York averages 44 per cent. The Leckie ore at Torbrook averaged 49.20 per cent. for a number of years. As delivered to the Londonderry furnace, the shell ore at the Wheelock mine, Torbrook, ran 42.74 per cent. as an average for 1906, and 44.05 for the first four months of 1907.

The somewhat similar ore at Arisaig varies much, largely owing to the percentage of silica. Some extensive beds are too low in iron and too high in silica to work at all, while others are fair, especially in the west. A general average of 54 samples of the eastern two-thirds of the district, by various analysts, gives 40.05 per cent. iron.

**Limonite.**—The limonites of the United States, as worked, range from 40 per cent. to 50 per cent. iron. A fair average is 47.90 per cent.

The important limonite deposits in Nova Scotia belong to two groups—the Londonderry series and contact pockets.

At Londonderry and Brookfield, the two localities considered, the iron contents vary within wide limits, depending not only upon the amount of impurity, but also upon the type of ore and degree of hydration. An average of many furnace runs at Londonderry gives 43.36 per cent. iron.

The Brookfield limonite, averaging thirty-seven

analyses of shipments to Londonderry, gave 46.62 per cent. At the Ferrona furnace the average was said to be 47.5 per cent.

**Siderite.**—Siderite, iron carbonate, the "white ore" of Londonderry, is an important constituent of the deposits of that locality. It is mixed with ankerite and limonite. Theoretically it carries 48.27 per cent. of iron. As mined it averages 35.06 per cent. The Londonderry siderite belongs to the magnesian sub-species sideroplesite.

**Ankerite.**—The formula for this mineral calls for 50 per cent. calcium carbonate, 21 per cent. magnesium carbonate, and 29 per cent. iron carbonate, or 14 per cent. metallic iron. It is usually mixed with varying amounts of siderite, sideroplesite, specular ore and massive limonite.

This variety is uncommon, and nowhere else than in the Cobequid Mountains is it of great importance in

carry an average exceeding 10 per cent. The limonites range from a low figure up to 23.02 per cent. silica. The Arisaig hematites are highly siliceous.

Alumina is rarely present in important quantity. Most often it is negligible.

Manganese is most irregularly distributed. The Torbrook ores carry only minute quantities. The Londonderry ores run from nothing to 2 per cent., a general average of all ores being about 0.506 per cent.

Titanium is practically absent. Analyses reporting its presence require checking.

Phosphorus is uniformly high in the bedded Clinton ores of the Silurian; sometimes high and sometimes low in the Triassic trap iron ores. The ores of South Mountain, Torbrook, give an average of 1.995 phosphorus. The average for the massive red hematite of the Leckie veins is about 0.992 per cent.; for the magnetic shell ore, 1.110 per cent.

♣ IRON OCCURRENCES.

smelting iron. Hence a brief description of its appearance and fluxing qualities may not be out of place here.

When pure it closely resembles white siderite. It crystallizes in rhombohedrons, and in coarse specimens the surface of the rock is made up of numbers of intersecting rhombohedral faces. Weathered faces show cross-hatched lines, and are brown in colour. Since it contains iron, lime, and magnesia, it is useful as a flux, and at the same time contributes to the iron content of the furnace charge. At Londonderry it renders possible the use of limonite of lower iron value than would otherwise be serviceable; but it requires a larger proportion of ankerite than would be used if an ordinary limestone were employed, because of the low percentage of calcium carbonate.

**Impurities.**—Many of the Nova Scotian ores are high in silica. The magnetites of the Triassic trap

The contact deposits of limonite are everywhere low. The Londonderry ores, both brown and white, are practically free from it. The magnetites of Barachois give 0.03 per cent., and are thus of Bessemer grade. The Arisaig ores are uniformly high, an average of 36 analyses from the eastern two-thirds of the district giving 0.572 per cent.

**Sulphur.**—Of this deleterious substance there is little in most of the Nova Scotian deposits, while some ores run high locally.

**Pre-Cambrian.**—The pre-Cambrian mountain protaxis of Cape Breton, upon which the whole structure of the island is built, is not sufficiently well known to be subdivided accurately. In the survey of Robb and Fletcher which culminated in the series of one-mile-to-the-inch geological sheets issued by the Geological Survey in various years up to 1885, parts of this complex

are differentiated as upper pre-Cambrian, or the George River limestone series, the characteristic feature of which is a light coloured dolomitic limestone. So far as known, the iron ore of the pre-Cambrian occurs in these rocks. But a large part of the area occupied by the old mountain cores has never been surveyed or prospected in detail; and not only is it possible that the George River series may be far more extensive than is now supposed, but there may be bodies of ore in other subdivisions of the pre-Cambrian. Much geological work remains to be done in middle and northern Cape Breton, especially along the line of exploration for various useful minerals.

The iron ore of the George River series is in part hematite, sometimes apparently bedded, and in part magnetite. The latter is in places distributed in granules through dolomite, being here and there segregated in sufficient amount to form pockets, of no great promise in any so far discovered. In other localities are larger irregular accumulations, partly replacements of limestone, partly occupying fissures. These are massive ores.

The gold-bearing (Meguma) series, which occupies so large a part of the mainland of the province, contains no workable ores. A few deposits of small size are connected with isolated patches of lower carboniferous which overlie the older rocks. The known Cambrian, as indicated by fossil contents, is restricted to small portions of eastern and southern Cape Breton, and, so far as known, holds no ore, except in one place. In upturned limestones and slates near Barachois, Cape Breton, are specular and massive red hematite and siderite, roughly conformable with the stratification, and lying on both sides of a contact with lower carboniferous strata. They have not been sufficiently explored to indicate great size.

**Ordovician.**—This series, called Cambro-Silurian in earlier studies, occupies large and irregular areas in the northeastern portion of the mainland, in Antigonish County.

The ores now known are chiefly in the vicinity of Arisaig, and are bedded hematites. They are less regular than the bedded ores of the Silurian in size, composition, distribution and relation to the country rock.

**Silurian.**—In Antigonish County a large basin of Silurian at Arisaig holds a few beds of hematite parallel with the strata. In Pictou County are many veins, partly hematite, partly siderite, which will be considered in Volume 2.

The greatest development is in the west, in Annapolis County, and includes the most promising deposit in the province so far opened. This is the bedded hematite series of Nictaux and Torbrook, and a small but perhaps important area at Clementsvalle, of similar character. The former contains the only ore which has been proved to any considerable depth, having been cut with calyx drills at 620 feet on the Lean Hematite vein, and worked to approximately 340 feet on the Leckie vein, most of it below sea-level.

**Devonian.**—By far the most widespread ores are those of the Devonian, being found from eastern Cape Breton westward through the southern part of that island, through Guysborough and Pictou Counties and into Colchester and Hants Counties, the one north of Cobequid Bay, the other south. Indeed the westernmost occurrences are far into Cumberland County, along the south side of the Cobequid Mountains.

These ores are varied in their character. In parts, especially in Guysborough County, they are high-grade

specular hematites, but apparently in small detached bodies. In Colchester County are the Brookfield deposit and the Londonderry range. The former is an irregular lode of limonite, occupying the Devonian slates immediately below their contact with the lower carboniferous; but instead of lying along this contact the lens stands on edge, as it were, extending directly downward into the slates. The Londonderry zone of ankerite (lime-magnesium-iron carbonate) and limonite has been a centre of interest for many years, in part because of its almost unique character. The iron ore is an alteration from carbonates, the complete series being (1) limestone and calcareous quartzite, (2) siderite (iron carbonate), (3) ankerite, (4) hematite and limonite, the last itself passing through several stages. The location of the ore is a series of easily replaceable beds that have felt especially severely the mountain-building which has given the Cobequids their present character.

**Lower Carboniferous and Triassic.**—Iron ore deposits in the limestone (Windsor series) are not abundant, but the contact deposits of Bridgeville and Sunnybrae, Pictou County, are replacements of limestone at the contact with older rocks, the ore going only to a moderate depth. The contact presents an irregular, broken or zig-zag line, and the iron ore pockets, which are crescent-shaped in surface plan, occupy the apices of the limestone scallops.

Part of the deposit at Barachois, Cape Breton, is in lower Carboniferous conglomerate; and here and there, as north of Whyecomagh, small amounts of hematite occur in the so-called metamorphic series.

The Triassic has many small and isolated magnetite and hematite bodies in the trap, but few are of economic value, because of their limited tonnage.

Thus it will be seen that the iron minerals of Nova Scotia have a distribution as wide geologically as it is geographically. There is, in the province as a whole, a great amount of iron oxides, but only a small portion of the total number of occurrences will probably prove workable at any time on a scale which should command the attention of capital.

### Mining Policy.

**Cost of Labour.**—A cost sheet supplied by a large worker in iron ore in Nova Scotia gives the present wages for mining and quarrying as follows:—

|                                               |               |
|-----------------------------------------------|---------------|
| Quarryman or underground miner, per day.      | \$1.40—\$1.50 |
| Drillman .....                                | 1.75          |
| Ordinary fireman, per day .....               | 2.00          |
| Foreman, per month .....                      | 65.00         |
| Expert engine man and mechanic, per month.... | 75.00         |

This may be compared with Wabana—\$1.10 per day for unskilled labour, and \$1.50 for drillmen, up to May, 1907; at that time wages rose materially.

All these costs seem extremely low to a westerner, yet they are 25 per cent. higher than a few years ago. But while they may mean no less in annual savings to the labourer, owing to differences in cost of living, these low wages do make an item in favour of a low total cost of production of the ore in the province.

As against this item, however, must be set off several others. One is the small size and uncertainty of many of the deposits. Where they are large and permanent they may be uncertain, as at Londonderry; low in iron and high in silica, as at Arisaig; or moderately expensive to work, because of attitude and depth, as at Torbrook. Still, while costs as low as at Wabana or in the Lake Superior region cannot be expected, it should

nevertheless be possible to mine ore in a number of parts of the province not now producing, at an expense which meets market conditions; and the author believes that this will be found to be the case.

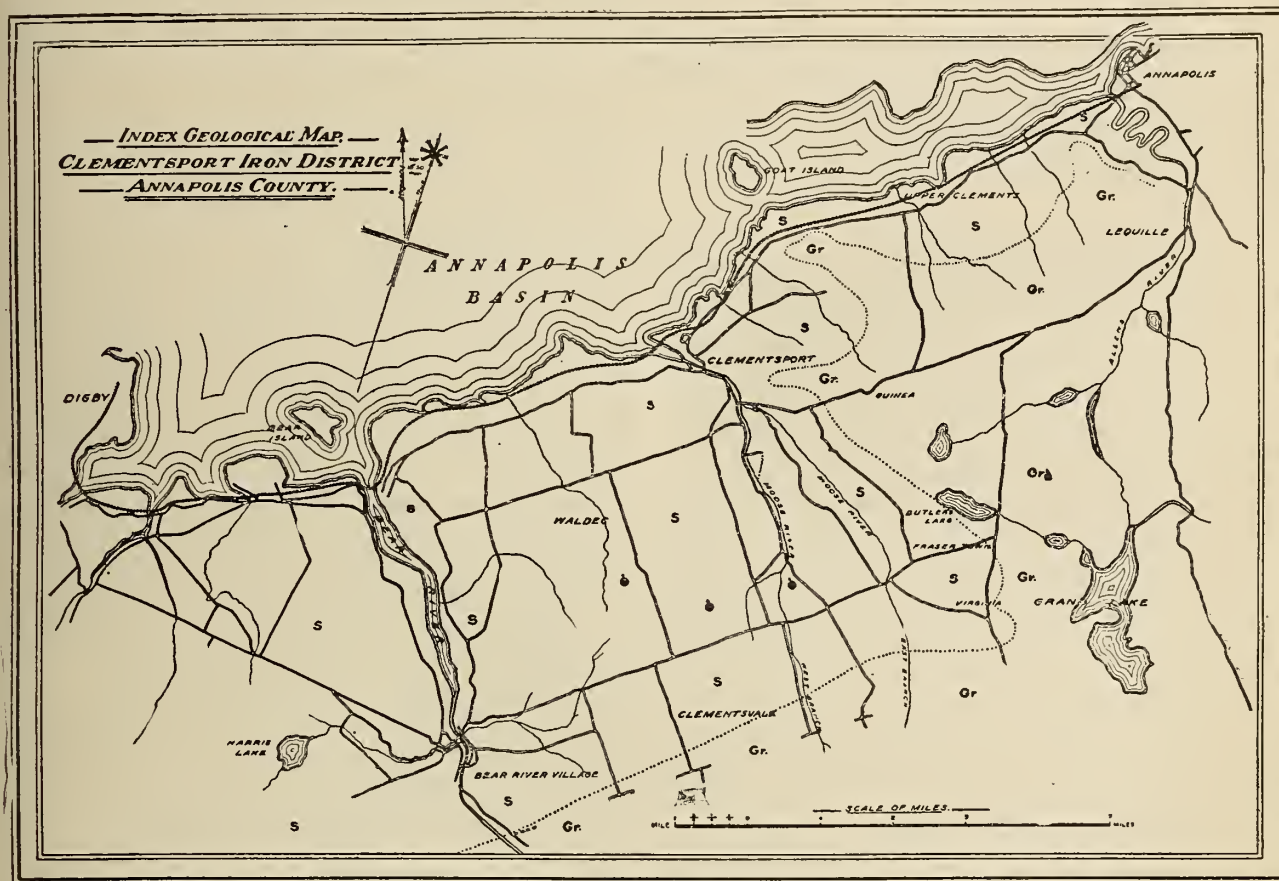

Some of the labour is unionized, much of it is not. It is difficult to secure or to keep a good quality of miners in this industry in sufficient numbers to meet even the present need. Metal mining of all sorts has been for some years conducted on so small a scale as to turn out few men who thoroughly understand the work. Imported labour has thus far proved more or less unsatisfactory. Indeed, of all the immigrants arriving at the port of Halifax every year, but a handful remain in the province of Nova Scotia.

**Capitalization.**—One of the most serious drawbacks to any success which might otherwise come to the iron industry of the country is the financial method em-

ployed, if, instead, the individual owners were to develop them and contract for sale of the ore to the smelters, if necessary attempting an understanding with one of the smelting companies whereby the latter supplies the tools in instances in which the owner has no capital upon which to work, even under the present market conditions a number of the isolated deposits could be profitably opened up. This plan is known to be feasible, because it is in practice to-day.

The wisest method for working the small deposits, then, is individual ownership and tonnage contract with the smelters. This is now employed by one of the companies for a considerable amount of ore each year.

**Smelting Centres.**—Mention has been made of natural geographic divisions into which the iron ore regions of Nova Scotia group themselves. Of these the eastern section requires little comment. There is no

ployed in certain instances by the owners of the land, holders of iron ore leases, middlemen, self-styled financiers and all concerned in the movement to boom a tract of iron ground.

Time and again have owners of land on which the iron ore was not reserved to the Crown held out for most exorbitant prices for territory not even properly explored, much less developed. If, instead of attempting to market these properties at unapproachable figures, serious effort were made to work them individually and to get what profit is possible while the ore lasts, more prosperity would result.

A large number of the iron ore deposits of the province are such, in extent and quality, that no ethical sanction can be gained for the practice of large capitalization. It is even an open question whether it would pay existing smelting companies to buy them up. But

immediate probability of any Cape Breton deposits developing to such size as to require or permit local reduction.

The east central division requires further study before much can be written about it. Some years ago a smelter was erected at Ferrona, in Pietou County, and the steel mills at Trenton, north of New Glasgow, later came to handle its pig. This furnace used Pietou County and Brookfield ores, which have proved to be local and limited; and on account partly of the development of its Bell Island deposits in Newfoundland, the Ferrona works were dismantled, and the large smelters at Sydney Mines erected by the Nova Scotia Steel and Coal Company. How much iron ore could be depended upon within the field outlined on the map as properly feeding this centre it is impossible to state without study subsequent to the preparation of this

volume. At present the only large deposit known is that of Arisaig, part of which would not pay to work under the present conditions of market and metallurgy. But the possibility must be kept in mind that in the future it may be feasible again to erect a plant in the vicinity of New Glasgow, where fuel and flux can be assembled with the iron ore at a minimum expense.

There remains consideration of the west-central and western regions. At present the former is drawing upon three sources—the Londonderry range, Torbrook, and, to a small extent, Brookfield. If the Clementsport ores should be found of sufficient grade upon proper exploration—which, by the way, they have never had—they are as suitable as Torbrook ore for the furnace, and of the same variety and characteristics. They are nearer Annapolis than is Torbrook, and they naturally become a part of any large proposition looking to the development of the western ores.

The Londonderry ores are difficult to work upon a sufficiently large scale, without the aid of Torbrook or some other deposit. The capacity of the latter remains to be seen, but it will be by far the largest in the province unless some new deposit of great extent be discovered. Speaking entirely impersonally, it seems as though Parrsboro offers a most suitable site for a plant of large size.

To it could readily be brought the ores from the whole western Cobequid range directly. Annapolis is, according to plans already on foot, to be a shipping port for the Nictaux-Torbrook field, and Clementsport would feed this as well. Brookfield is but eight miles from Truro, and with a Truro-Parrsboro railway, survey of which has been made and charter issued, it is within as easy reach of that town as of Acadia Mines (Londonderry) to-day. The Hants County deposits also would reach Parrsboro as easily as Acadia Mines.

Flux would come from the Londonderry range (ankerite) and from Hants and Colchester Counties, especially at and near Windsor (limestone). Fuel would come chiefly from Springhill, along the road over which most of the tonnage now goes, giving a short downgrade haul and avoiding the costly and round-about freightage across the Cobequid Mountains, now necessary on the Intercolonial Railway. The road from Springhill mines to Parrsboro crosses the mountains by a low pass, which involves no heavy grades. Should the buried western section of the Cumberland coal field be developed, there would be one or more additional sources of fuel at close range.

It is a large enterprise even under present conditions; but it appears as though it might be possible, and is worth investigating by capitalists. It is the only case of its kind in the province that would not require long and costly exploration of iron fields before being regarded seriously.

#### **Titles to Iron Ore—Systems of Holdings.**

**Two Systems.**—In Nova Scotia two systems obtain, under which iron ore is held as property. The situation, which is almost hopelessly involved in some localities, has been explained as clearly as is possible by the late Dr. E. Gilpin, Jr., Deputy Commissioner of Works and Mines of Nova Scotia (Mineral and Crown Land Grants in Nova Scotia; Trans. Roy. Soc., Can., vol. IX., 1903, pp. 123-134).

In some parts of the province title to the iron ore remains vested in the land; in others the iron is reserved to the Crown, and in certain districts both systems obtain, to the great confusion of titles. The exact condi-

tion depends upon the date of the original grant of land and the nature of the clause contained in it reserving certain minerals.

**Earlier Grants.**—In grants up to the year 1808 no reservation of iron ore was made by the Crown, but from that year onward reservation was a feature of the grants. "It follows, therefore, that, in many of the older township grants issued between 1759 and 1785, the Crown does not profit by the mining of this ore. This is notably the case in the grants of Guysboro, Londonderry, Nictaux and Clementsport, and in numerous large blocks of land granted to the Loyalists and early Scotch settlers in Antigonish, Pictou and Colchester Counties." In all of these, title to ore is vested in the land, and no royalty is paid to the Provincial Government on the ore.

In 1826 a royal grant was issued conveying to the Duke of York and Albany all the mineral rights of every description in the province, except those previously issued and in process of working. The rights were transferred to an organization in London, known as the General Mining Association, which kept them until 1858, at that time releasing to the Provincial Government of Nova Scotia all rights except those to certain tracts of coal land. Thus all rights to iron ore, except those to certain early grants, came under control of the province. These rights included those in ungranted lands, in lands granted between August 25, 1826, and the date of settlement in 1858, and in all iron reserved in lands granted previous to August 25, 1826.

**Acts of 1858.**—The acts of 1858, chapter 2, next came into force, reserving gold, silver, lead, tin, iron, coal, and precious stones, and leaving all other minerals unreserved. This continued in force until 1892, when all minerals, except limestone, gypsum and building material, became reserved.

**Cape Breton Island.**—In Cape Breton, while most of the iron ore is reserved to the Crown, some is not; and as the history of that country is most complicated, and is different in the early years from that of Nova Scotia, it is inadvisable to attempt here to explain the conditions. They can only be learned in the specific cases when attempt is made to get title to the ore.

**Records.**—In the office of the Department of Crown Lands in Halifax the grants are recorded in two series of books. One of these is numbered, the other lettered. In general it may be said that iron is reserved to the Crown in the grants which are labelled on the Department maps as referring for description to books designated by letter, and in the numbered books it is not reserved. More specifically, however, iron ore is reserved in those grants recorded on the maps as of books A to Z, except part of book R, and books 12 to 64.

The Crown Lands Office has maps and records only of the original grants. For all information regarding present ownership search has to be made in the various county registry offices, a slow and uncertain process. The system is by no means perfect. It is often difficult to discover the present ownership, or to find accurate maps or descriptions from which one can do his own surveying.

**Ownership and promotion.**—Taking advantage of the condition of ownership of such iron ore as goes with the land, a common method among promoters, in order to secure such title as will enable them to work off a sale at their own convenience, is to procure from the owners of the land an option, paying a small deposit, \$50 to \$100, the option binding the owner to sell at a

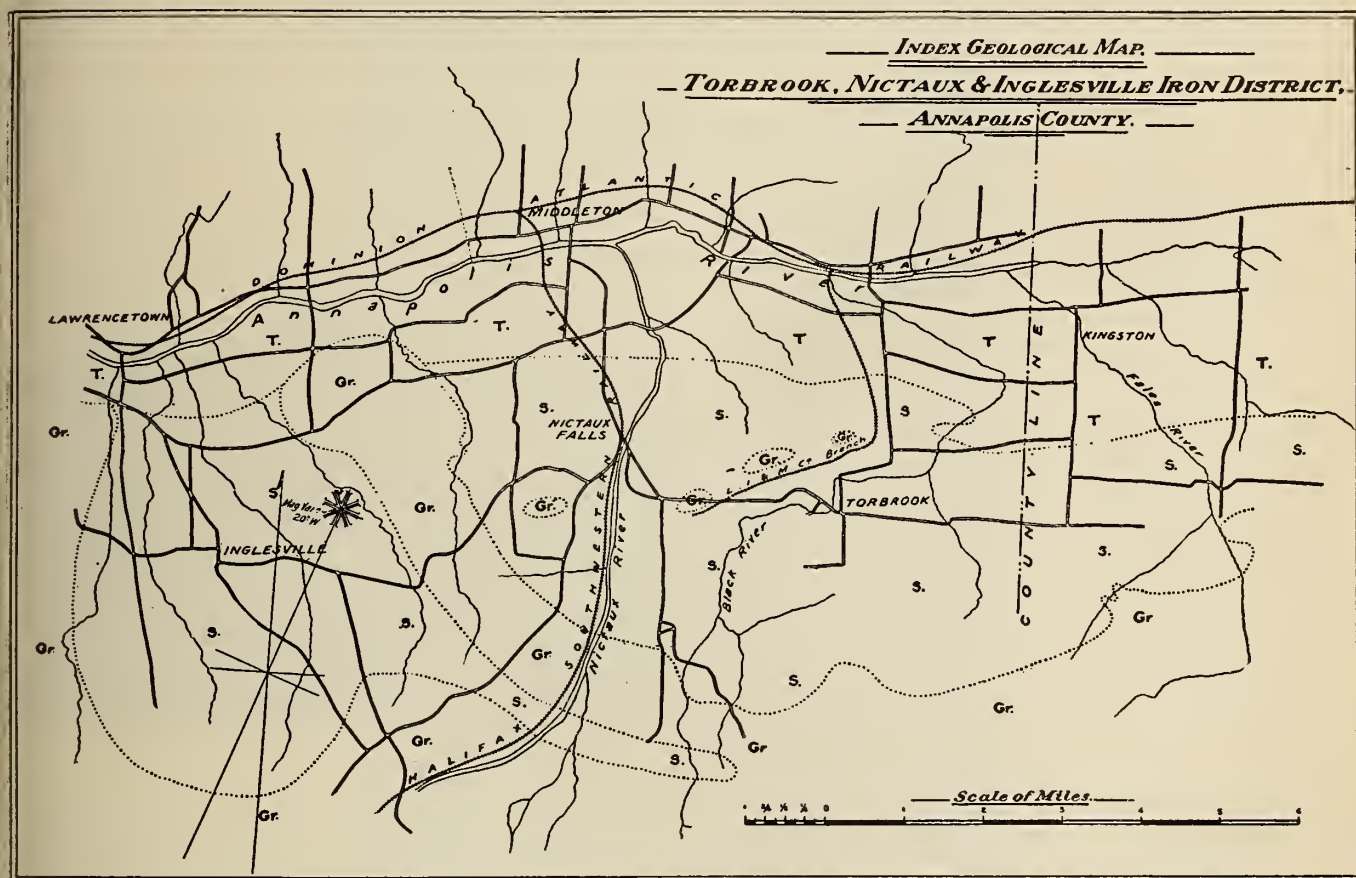

specified price but neglecting to bind the purchaser to buy within a specified time. The balance of the payment is to be made when the promoter closes his mining deal. Cases are not uncommon, if reports be true, in which the owners, after waiting a considerable time for the first bonders to put this deal through and make payment, have yielded to the persuasion of a newcomer, rebonding the property indefinitely and receiving another small advance payment therefor. Meanwhile, because of the wording of the option, the first bonders' legal hold on the property continues. Thus the difficulty of a final purchaser, ignorant it may be of the earlier history of the case, is very great in securing a clear title. The involved condition may easily discourage an investor and result in a failure to buy.

Unfortunately, it is much to the interest of any promoter to get an option upon mining properties that

ment will locate areas upon application. For any number of these areas licenses to search may be taken out at the Mines Office. For all purposes of license and lease, every area is composed of five unit rights, each containing one square mile, and the applicant receives one, two, three, four or five rights to search, according to his application. Should he apply for but one right, and no one is before him, he is given a first right; should he apply for two, they are first and second rights, and so on through the five. Should he not apply for all the possible rights, anyone else is at liberty to make application for and to receive any or all of the remainder.

**Conversion to leases.**—On or before the expiration of eighteen months the licensee must exchange the license of his first or otherwise earliest right for a lease of one square mile.

shall omit any time limit. The only gain which the owner would seem to derive from such a bargain is the opportunity to secure a second small initial payment, should a new adventurer arise. But this gain would appear to be slight, contrasted with the probable failure to consummate any final sale to which the dishonest practice described above leads.

#### Leasing From the Crown.

As the information contained in this report is in part for those outside the Province of Nova Scotia, the following general description is given of the procedure in acquiring rights to iron ore reserved to the Crown.

**Licenses to Search.**—The mining districts are divided into areas of five square miles each, in shape 2.50 by 2.00 miles. In a new district the Mines Depart-

This, if he is exercising a first right, he may choose from any part of the area, but its length must not be more than two and one-half times its breadth. This exchange he must continue to make at intervals of eighteen months or less, until all his rights are exhausted. If he does not possess all five rights, the rights of any later applicant are convertible in due course of time and in order, after his own have been exhausted, until in all five rights have been converted into leases. This would take seven and one-half years. Whenever a first right is converted into a lease, but four are left, and what was a second right becomes a first right. This change of numbers recurs at each conversion.

**Lapsing of licenses.**—There is one method that may be employed, if one does not desire the expense of a

lease at the time and is not working the property. Upon the expiration of the eighteen months the first right, if unconverted, lapses; the second becomes the first, and so on, leaving the fifth right vacant. The applicant may immediately, at 10 a.m. of the day following that in which the first right lapsed at close of business, make application for the vacant fifth right. But as some claim jumper—of whom there are not a few—may apply simultaneously, or a moment ahead, the proceeding is a dangerous one.

**Costs and tenure.**—The cost of a right to search is \$30, or \$150 for the whole area. This is a single charge, and the privileges which it confers last throughout the whole seven and one-half years without additional expense chargeable to the licensees themselves. The leases cost \$50 per square mile for the first year, and \$30 per square mile per year thereafter. The lease runs for twenty years, subject to three renewals, so that an operator may control iron lands from the Crown consecutively for eighty years. The fees for leases may be paid yearly, or for the whole twenty years in advance.

(To be continued.)

### GOLD MINING IN NEWFOUNDLAND.

Although little or no effort has been made to mine the auriferous deposits of Newfoundland, the reports of the geological surveys and of various private prospectors bear out the statement that gold is to be found in various parts of the island in quantities that will repay development of these areas. Assays of the ores of the baser metals, as copper and iron, have very frequently shown the presence of the precious metal and, in the case of the Tilt Cove Copper Co., for instance, appreciable quantities are often extracted from the products of some of the Newfoundland Mines. It is remarkable too, that the quantity extracted from the ore mined in the locality cited does not show any very great annual variation. In 1896 it was worth upwards of \$62,000 and in 1897 the value was the same. In 1898 the figures given were \$58,000. Gold to the value of \$25,000 has been extracted from the Tilt Cove ore during the last five years. The total value of gold mined in the island in any one year has never exceeded \$150,000.

One promising auriferous area has been discovered at a place called Sops Arm, situated in White Bay. This has been thoroughly explored by the government geologist and with encouraging results. The most pronounced auriferous rocks belonged to the Silurian series, although the gold was not confined to these. The quartz veins were numerous, generally running in the strike of the slates and seemingly conforming with them in the dip. One shaft sunk passed through several veins and one belt was found to consist of mixed quartz and slate over thirty feet in thickness. This latter was found to contain gold in quantities ranging from a mere trace up to several ounces to the ton. The district contains all the conditions characteristic of auriferous regions. The quartz veins have an aspect that suggests the presence of the precious metal. In colour they are a dull white, are not vitreous, and contain considerable intermixture of calc and brown spar, so that they are comparatively soft and easily crushed. The gold is frequently seen in the quartz entirely independent of other metals, but it is also found in association with zinc and galena. The geologist reports that the gold is

for the most part not visible, but that some rich specimens were seen in small nuggets, and that strings of the precious metal arranged along weathered edges of the quartz were quite perceptible. Several washings were made in his presence from quartz in which gold was not previously discernible even when the lens was used. Yet nearly all these washings exhibited signs or colours of gold and some were quite rich. One in particular, made from about three ounces of crushed vein rock, yielded an average of about ten ounces to the ton. Other washings made from material taken from a shaft and a distance of about thirty feet below the surface panned out about fifteen ounces to the ton. Desultory prospecting at another place, Cinq Cerf, showed the presence of gold in quantities ranging from a mere trace to a value of \$6 or \$7 per ton. Not very alluring certainly at first sight, but it must be remembered that these results were obtained from mere scrapings of the surface and that no systematic or extensive

STAMP MILL AT MING'S BIGHT, NEWFOUNDLAND.

prospecting of this area has been done. The property has really not been given an adequate test.

At Rose Blanche on the south seaboard of the Island is an auriferous area that the Director of the Newfoundland Geological Survey regards as of some importance. He states that the gold is there distributed rather sparsely through quartz leads, but is of the opinion that if mining methods similar to those of Canadian companies were employed, it could be extracted in paying quantities.

The only locality where gold mining in Newfoundland has been attempted on any considerable scale is at Mings Bight in the northern part of the island near the entrance to White Bay. Here an outfit consisting of a ten-stamp mill and a Wilfrey concentrator has been placed on the ground and an attempt has been made to discover just what the area is worth as far as gold production is concerned. The deposit is of the bedded type and is composed of magnetite slate, quartz, and pyrite. It dips north at an angle of about 60 degrees. The auriferous lode has been traced for

fully a mile through the company's property, which is known as Goldenville, and has a width of from 5 to 13 feet. A trial shaft was first sunk 50 feet on the eastern extremity of the deposit, then a working shaft was sunk at a point half a mile further west, and continued down to a depth of 100 feet. When this shaft had attained a depth of 17 feet a shipment of about twenty tons of ore was made to the Brookfield mine, Nova Scotia, for the purpose of having a mill test. This, upon being treated by amalgamation and cyanide process, yielded 11 ounces of melted gold, valued at \$209.00, as per N. Y. Assay office certificate, which is equal to a recovery of \$9.08 per ton; in addition five tons of slimes carried a total value of \$55 which was

4. The total recovery equalled 11 oz., in melted gold at \$19 per ounce, or \$209. Value recovered per ton equalled \$9.08.

A value of \$46.20 per ton in gold was obtained as a result of a test made on concentrates, the total cost of the treatment being \$2.40 per ton.

This result was considered so satisfactory that the shaft was continued and at a point 80 feet below the surface, levels were driven east and west along the lode, in the former case for a distance of 80 feet and in the latter 51 feet. The ore taken from the shaft was continually sampled, the samples being sent on to New York. A result of some thirty assays shows an average of \$12.44 per ton, a fairly good showing.

AGALMATOLITE—PSEUDO-TALC—NEWFOUNDLAND.

See issue of September 1st, page 525.

not saved. The detailed result of this test was as follows:

1. By amalgamation, bullion recovered, 8 oz., 4 dwts. (retorted gold).

2. Treatment of tailings by cyanide process: Assay value of sands, \$3.20 per ton; slimes, \$11 per ton. The value of tailings sampled at end of plates, \$4.95 in gold and 21c in silver, a total of \$5.16.

3. Cyanide test: Number of tons treated, 217.85; average value, \$4.43; recovered in bullion, 3 oz. 9 dwts; time of treatment, 54 hours; consumption of cyanide, 3 lbs. per ton; percentage of recovery, 82.

#### FILTERING GOLD SLIME.

The following method of filtering gold slime is given by Mr. E. Jansen, metallurgist to the Oroya Black Range Gold Mining Company:—"In small cyanide plants where a clean-up press is not provided, the filtering and washing of the gold slime after acid treatment of zinc is generally found to be a slow and tedious process, but the following arrangement can be very cheaply installed. It will save much time in the clean-up, and is, in fact, with small plants, a good substitute for a filter-press. The whole operation of washing and filtering can be done in the acid tub, and consists simply of applying the principle of vacuum filtration to the

clean-up. The appliances necessary are a filter-frame, a vacuum chamber and a vacuum pump. The frame is constructed of 3-4-inch piping, screwed together in the form of a square, with a T-piece let into one of the sides, to which pipe and hose can be fitted; the sides of the pipes toward the centre have 1-4-inch holes drilled every six inches. A filter cloth to fit the frame is made of two pieces of good canvas or cotton duck, between which are two layers of coarsely-woven cocoanut matting. The four layers are all held together by a few rows of stitching, about 3 inches apart. The cocoanut mat layers are made so as to fit easily inside the frames, the duck being left large enough so that the top and bottom layers can overlap the frame on opposite sides and can be well sewn together all round. This then forms an efficient cell for filtering solution. The frame is made of such size as to fit the bottom of the acid tub, with about 2 inches clearance all round. The vacuum chamber can be conveniently made from a sulphuric-drum, fitted with pipe connections.

After the acid treatment is finished, the tub is filled with water, and the contents well stirred, then after the precipitate has settled, the clear solution is decanted off. The remaining gold sludge is well stirred and the frame is put into the tub, and the cock to the vacuum chamber and pump are opened. The frame should lie horizontally on the bottom of the tub and remain there until all the liquid is drawn off; it can then be lifted from the bottom and placed upright against the side of the tub while sufficient water is run in for washing. The slime adhering to the frame is scraped off, and, together with the rest of the slime in the bottom of the tub, is thoroughly stirred up with the water. The frame is again laid horizontally on the bottom of the tub and the vacuum cocks are opened as before. One washing in most cases will be ample, but can easily be repeated if insufficient. After the liquid is all drawn off, the vacuum is maintained for a time so as to air-dry the slime as much as possible. The slime is then collected from the frame and from the bottom of the tub; with careful scraping very little need be left on either. What is left can, however, be collected by washing and sponging the tub and frame with about half a bucketful of water. The washings can then either be filtered through a small calico filter, or use may be made of the filter frame by laying it down flat and, with the vacuum on, slowly pouring the washings upon one side of it; when dry the slime is carefully scraped off. If the filtering is slow with only one frame, there is no reason why two or more should not be used."

### NEWFOUNDLAND PETROLEUM AREAS.

For a number of years it has been known that the formation of the west coast of Newfoundland—proschists at the base of the Silurian series—is oil bearing, and the desultory prospecting that has been done has proven that petroleum areas of considerable extent do exist there. Operations were carried on for several years at a place known as Port au Port on this coast and with satisfactory results. Three or four wells were drilled and at least three of them struck oil at from 136 to 684. The shallow well is said to have produced ten barrels a day for a month. The color of the oil is dark amber, the gravity 33 deg. Baume, and it possessed good lubricating qualities. Financial difficulties are supposed to have interfered with the increased and continued development of the area.

The Parsons Pond area, situated a little farther north along the same coast, is even more promising. The best of judgment does not seem to have always been displayed in the method of exploring the area, but in spite of this good results have been obtained. All the wells first sunk showed oil in greater or less quantity, one of them yielding 18 barrels of oil after about an hour's pumping. In 1901 the developing company put down a well to a depth of 2160 feet and struck oil in large quantity, the quality being superior. The oil apparently came from a lower set of petroliferous strata than any that had been previously bored. It burned freely even in its crude state and did not generate any explosive gas. By this year the company had sunk five wells, and while the quantity yielded was not very great, not one of them was dry. A new well sunk the following year to a depth of over 1,200 feet also struck good oil in considerable quantity. Attempts made to torpedo these wells failed, yet the season after the attempt was made on the deepest well, it was found to contain 900 barrels of oil.

During the season of 1904 several new wells were sunk in this area. One, partly drilled the year previous, was sunk to a depth of 2,050 feet, oil being struck at 1,470 and 1,750 feet. The well yielded an average of two barrels per day. A two months' test of this and three of the other wells resulted in an average daily yield of six barrels. Two wells were next sunk on the north side of the pond (lake). One was drilled upwards of 1,400 feet but gave a very poor yield of oil. The other, however, was the most productive of the lot, was pumped steadily for five months, yielding 4½ barrels daily. The oil from this well differed considerably from that obtained from any of the others. It was of great body and had a pale amber appearance. The superintendent reported that it was exceptionally rich in the more valuable lubricating oils, giving excellent results when used on his engines. It also gave a rich yield of paraffin, waxes and other useful by-products. During the season of 1906 two deep wells were sunk, but operations were not carried on with any very great vigor and some of the old wells became "drowned out." The company has unfortunately been hampered by lack of capital, a difficulty that has caused the failure of attempts at developing many promising Newfoundland areas. There is every reason why this petroleum area should be carefully and systematically developed on a large scale. The desultory operations carried on there have proved the existence of oil in paying quantities, and, further, analyses of this have proven its value for many industrial purposes. Several hundred barrels of the oil was used at the gas works in St. John's to enrich the gas production, the experiment being attended with most satisfactory results.

### AMERICAN MINING CONGRESS—PROVISIONAL PROGRAMME.

A partial list of the speakers who will appear at the programme for the twelfth annual session of the American Mining Congress, at Goldfield, Nevada, September 27th to October 2nd, appears below. The Programme Committee has not yet completed its work and this list will be materially augmented before the final programme is published:—

1. "Purchasing Coal by the B. T. U. Method," by Samuel A. Taylor, E.M. and C.E., Pittsburgh, Pa.

2. "The Paralysis of Mining Districts," by E. B. Kirby, St. Louis, Mo.

3. "The Forest Reserves and Other Public Land Questions," by Senator Weldon B. Heyburn, of Idaho.

4. "The New Experimental Ore Dressing and Metallurgical Plant of the Colorado School of Mines," by Prof. F. W. Traphagen.

5. "Industrial Accidents and General Liability Laws," by David Ross, Springfield, Ill.

6. "Old Days on the Comstock," by William C. Ralston, San Francisco, Cal.

7. "State Inspection of Metal Mines," by Courtenay DeKalb, San Francisco, Cal.

8. "Some Defects in State Inspection of Mines," by Harry A. Lee, E.M., Salt Lake City, Utah.

9. "Zinc Mines in the Good Springs District," by Douglas White.

10. "Geology and Ore Deposits of the Round Mountain District," by J. P. Loftus.

11. "Some Grievances of Ore Producers Against the Smelting Combine," by James H. Fox, E.M., Seattle, Wash.

12. "The Geology of the Goldfield District," by Prof. Chas. J. Moore, Goldfield, Nevada.

13. "Some Arizona Suggestions in Mining Law Revision," by Fred. J. Elliott, Globe, Ariz.

14. "Protecting Mine Investors," by Floyd Davis, E.M., Ph.D., Denver, Col.

15. "The Florence Mine," by A. D. Parker, Vice-President C. & S. Railway, Denver, Col.

16. "The Bullfrog Mining District," by Clay Tallman, Rhyolite, Nevada.

17. "The Ely Mining District," by Hon. S. W. Belford, Ely, Nevada.

18. "The Application of Steel to Mining," by Prof. R. B. Woodworth, Pittsburgh, Pa.

19. "The Effect of Silver Values Upon American Trade with Silver-Standard Countries," by James A. Heckman, representing Merchants' and Manufacturers' Board of Trade of New York City.

20. "A Bureau of Mines," by D. W. Brunton, President American Institute of Mining Engineers, Denver, Col.

Silver Discussion.—Additional views upon the silver question will probably be offered by Sir Moreton Frewen, of London, England; James J. Hill, of St. Paul, Minn., and John Hays Hammond, of New York City. Officials of the Mexican and Canadian Governments are also expected to be present and take part in this discussion.

Other Discussions.—Special discussions will follow the committee reports upon the following questions:—"The Prevention of Mine Accidents," "A Tonnage Tax on Coal Output for Distribution Among the Victims of Mine Accidents," "The Standardization of Electrical Equipment in Mining Work," "Needed Changes in Alaskan Mining Laws," "The National Forest Service," "Vertical Side Line Law," "General Revision of Mining Laws."

Sessions will begin at 10 o'clock Monday morning, Sept. 27th, and adjournment will be on Saturday afternoon, Oct. 2nd. On Wednesday the sessions will be held in Tonopah, the citizens of that city providing a special train to convey the delegates from Goldfield early in the morning, returning in the evening.

## REPORT ON CHROMITE DEPOSITS.

The Mines Branch of the Department of Mines of Canada has just issued a "Report on the Chrome Iron Ore Deposits of the Eastern Townships," by Fritz Cirkel, M.E.

In the last few years, owing to the rapid development of the iron and steel industry in Canada, more than ordinary interest has been manifested by the mining and metallurgical public in respect to the Canadian deposits of raw materials and ores, which enter into the manufacture of iron and steel products. To meet the demand for information on these subjects, the Mines Branch has undertaken to issue a series of reports on the Canadian deposits of the substances which form the basis of the iron and steel industry. Several reports on iron ores and one on tungsten ores have already been issued and the present report is another of this series.

The scope of the "Report on the Chrome Iron Ore Deposits in the Eastern Townships of the Province of Quebec" is best judged by quoting the Table of Contents, which is as follows:

Introduction. Chapter I., Historical; Chapter II., The Chrome Iron Ore Deposits of Canada; Chapter III., Mining of Chrome Iron Ore; Chapter IV., Dressing for the Market; Chapter V., Market Prices, and Status of the Canadian Industry; Chapter VI., Chrome Iron Ore Mines; Prospects in Canada; Chapter VII., Chrome Iron Ores in Foreign Countries; Chapter VIII., Origin; Chapter IX., Composition of Chrome Iron Ores; Chapter X., Statistics and Chronology; Chapter XI., Determination of the Value of Chromium; Chapter XII., Uses of Chromium; Chapter XIII., Technology of Chromium and Its Compounds; Appendix II. Experiments with Chromite at McGill University; Bibliography."

The report is well illustrated by eleven plates in half tone, from photographs of mines, mills and machinery; and fifteen diagrams, maps and drawings, all illustrative of the chromite industry. The author of the report is Mr. Fritz Cirkel, mining engineer. This work was entrusted to Mr. Cirkel on account of his long connection, as consulting engineer, with the chromite and the asbestos industries; the deposits of these two substances in the Province of Quebec occur in the same region, and the origin of both is closely connected with the serpentine rocks of the Eastern Townships.

The topography of the report is good and the book will form a welcome addition to the library of the mining engineer, the metallurgist, and the capitalist interested in the iron and steel industry. Moreover, it may be pointed out that the chapters on the uses, the technology, the metallurgy of chromium, and those on the origin, the composition of chrome iron ores, as well as the bibliography, will be appreciated by all students and investigators on the subject of Chromium and Chromite.

The book is obtainable on application to Dr. Eugene Haanel, Director of Mines, Department of Mines of Canada, Ottawa.

## ELECTRIC SMELTING OF IRON ORES.

As a sequence to the reports on Electric Smelting of Iron Ores published in 1904, 1906 and 1907, the Mines Branch of the Department of Mines of Canada has just issued the results of "An investigation of an Electric Shaft Furnace" in operation at Domnarfvet, Sweden. The investigation was made by Dr. Eugene Haanel in

December, 1908, on the invitation of the inventors, and the results given represent the latest developments of the electric smelting of iron ores.

The report contains 38 pages and is divided into four parts: Part 1 deals with the Domnarfvet furnace, the trial runs witnessed by the writer of the report and the comparative costs of production of pig-iron by the furnace. The other three parts, which are more of the nature of appendices, describe: (1) a new electric furnace for the manufacture of steel, (2) the manufacture of electrodes, (3) methods of manufacturing wood-charcoal, this material being used to supply the carbon

which enters into the composition of pig iron manufactured by electric smelting.

Three full page plates, from photographs, and numerous drawings, illustrate clearly the descriptive matter of the book, which, taken in conjunction with the reports previously published by the Mines Branch on the subject of electric smelting, brings up to date the literature on the electro-metallurgy of iron.

The "Report on the Investigation of an Electric Shaft Furnace" at Domnarfvet, Sweden, may be obtained on application to Dr. Eugene Haanel, Director of Mines, Department of Mines of Canada, Ottawa.

## THE LA ROSE DUMP.

Written for the Canadian Mining Journal by H. P. Davis.

After careful sampling and mill tests it was estimated on May 1st, 1909, that the various dumps at the La Rose mine, of the La Rose Consolidated Mining Company, contained 44,340 tons of concentrating ore assaying from 15 to 40 ozs. in silver to the ton and averaging 28.16 oz. to the ton, a total of 1,248,820 ozs.

Since that date the mine has produced approximately 10,000 tons of discard from the picking tables,

of \$562,850.00; deducting from this amount 12 per cent. for marketing charges will leave \$495,000.

A contract has been entered into between the La Rose Consolidated Mining Company, Ltd., and the Northern Customs Concentrators, Ltd., for the concentration of the dumps of the La Rose mine. This contract is on the basis of a certain fixed price per ton plus a percentage of the net smelter returns.

THE LA ROSE DUMP.

which averages about 15 ozs. to the ton, or a total of 150,000 ozs.

It is conservative to estimate that in these dumps to-day there are 55,000 tons of milling rock containing 1,400,000 ozs. of silver. Figuring on the basis of 85 per cent. extraction, this would yield 1,190,000 ozs. of silver of a gross value, at the present market price,

The cost of concentrating the 55,000 tons of mill rock, above referred to, and of loading the same on cars will be approximately \$186,000, leaving a net return to the La Rose Company of \$309,000. In addition to the 55,000 tons included in the estimate, there are about 10,000 tons in the main dump of "uncertain value," and as a portion of the old dump, which has

not been tested owing to the fact that it is covered up, will yield considerably higher percentage of silver than the estimated figures given above, it is safe to estimate a net return of not less than \$325,000 from the concentration of the mill rock in the dumps of the La Rose mine.

The La Rose mine is producing from its ore-sorting tables each day:—

|                                          |            |
|------------------------------------------|------------|
| 10 tons of 100 ozs. screenings . . . . . | 1,000 ozs. |
| 5 tons of 40 ozs. screenings . . . . .   | 200 ozs.   |
| 100 tons of 15 ozs. discards . . . . .   | 1,500 ozs. |
| 115 tons                                 | 2,700 ozs. |

The screenings have hitherto been shipped to the Denver Colorado smelter at the United States Smelting and Refining Company.

In concentrating ore averaging as high as 100 ozs. a recovery of 90 per cent. can be made. If this ore were handled by a local concentrator the daily production of screenings and discards from the ore-sorting table would yield a profit of approximately \$600 per day from the La Rose mine alone.

The Princess, University and Lawson are each producing milling ore in steadily increasing quantities. The Lawson mine will be productive of this class of material owing to the fact that, in addition to the strong and well-defined leads of high-grade ore, there are, on this property, a number of offshoots and small veins parallel to the main leads and the country rock between these offshoots and parallel leads and the main veins will make profitable concentrating ore.

Measurements taken across vein No. 11 at one point show 12 inches of bonanza ore, 5 feet of rock, 3 inches of ore, 5 feet of rock, 3 inches of ore, 2½ feet of rock and 2½ inches of ore, making a total of 20½ inches of high-grade ore in a zone of mineralization 9 feet in width.

### TUNGSTEN ORES IN CANADA.

A report on the Tungsten Ores of Canada, by Prof. T. L. Walker, of Toronto University, has just been issued by the Mines Branch of the Department of Mines of Canada at Ottawa. The report covers 56 pages and includes 15 illustrations.

Amongst the rare metals which have recently become of commercial value, tungsten is an important example. One of its most recent applications is as a filament in incandescent lamps, in which it gives a much more brilliant light with greater efficiency than carbon. Its most important use, however, is in the manufacture of tungsten steel, to which it imparts great elasticity and tensile strength. The metal has, therefore, become particularly valuable to the manufacturers of special steels. The known occurrences of tungsten ores throughout the world are comparatively few, which fact lends additional interest to some discoveries of scheelite (an ore of tungsten) which have been made within the past year or two in Nova Scotia. These, together with other occurrences of tungsten ores in Canada, have been made the subject of the present report, which is designed to present to those interested all the available information on these ores.

The several occurrences of tungsten ore in Canada are described in detail, and a general statement is given on the geological occurrences of the ores, chemical tests,

concentration, the uses of the metal, producing mines in other countries, statistics of the world's production, etc., while a very useful bibliography of the literature on Canadian and United States occurrences is added.

### CANADIAN PATENTS.

Below will be found a list of patents issued by the Canadian Patent Office on July 27, relating to mining and metallurgy, and furnished by Fetherstonhaugh &

OIL DERRICK AT PARSON'S POND, NEWFOUNDLAND.  
See page 558.

Co., 5 Elgin Street, Ottawa, Canada. Russel S. Smart, resident:—

119547. W. Scrimgeour, Norfolk, Va., furnaces and forges, Mires Fuel Oil Equipment Co.

119576. E. A. Custer, Philadelphia, Pa., modes of casting metal structures in permanent molds having permanent cores.

119590. R. Gartenmeister, Elberfeld, Prussia, Germany, processes for making readily inflammable phosphorous compounds or kindling and priming compositions, and compositions resulting therefrom.

119592. L. F. Gilman, Spokane, Wash., coffer dams for placer mining and pier building.

119606. W. Pfanhauser, Leipzig, Saxony, Germany, processes for the manufacture of ductile electrolyte iron.

119622. A. G. Betts, Troy, N.Y., processes of treating nickel ores.

119623. R. Huber, New York City, apparatus for desulphurizing ores.

119624. U. S. James, Newark, N.J., ore concentrators.

119644. G. V. Barton, Liverpool, Eng., salts or oxides of lead.

119656. L. Horst, Altona, Germany, carbonic acid motors.

119700. F. Concord, Swissvale, Pa., systems of distribution for mercury-vapor rectifiers, Canadian Westinghouse Co., Ltd.

119692. W. H. Yost, Montreal, Que., means for piling coal and the like, W. H. Yost, O. W. Meissner.

### EXCHANGES.

**The Mining Journal—75th Anniversary Number, August, 1909.**—The 75th Anniversary Number of our London contemporary is a formidable affair of more than 100 large pages of reading matter. Beginning with a sketch of its own history, it presents to the reader a large variety of articles, taking up progress in mining, ore-dressing and metallurgy.

On page 5 appears a reproduction of a page from The Mining Journal and Commercial Gazette, August 29, 1835, which is of unique historical interest. Despite the stilted phraseology, the editorial, 75 years old, displays commercial acumen and a laudable appreciation of the functions of mining.

We regret that the only article on Canadian mining is, to all intents and purposes, a prospectus of the Amalgamated Asbestos Corporation, Ltd. Thus the Mining Journal has fallen into one of the traps that are set for the unwary righteous everywhere. Of course, it has done so innocently.

Taken as a whole, our revered contemporary's anniversary number is decidedly worth while. It gives evidence of abundant vitality and enterprise.

**Mining and Scientific Press, Sept. 4, 1909.**—"Taxing Unoperated Land" is the caption of a leading editorial in this issue. The assessor of Huerfano County, Colorado, is to be removed from office because he assessed as grazing land the areas controlled by coal companies outside of the portions actually involved in mining operations. "If this step is taken," says the Press, "because of illicit transactions between the assessor and the coal companies, it is justified; otherwise it would seem to be drastic. The principle involved is not precisely that of taxing the unearned increment. No man can definitely affirm the amount of such unearned increment until a transfer of title occurs. Thus is seen the virtue of the laws prevailing in certain countries whereby real estate is not taxed directly, but an amount, usually five per cent. of the purchase price, is taken when the property changes hands. . . . Taxation is essentially a contribution out of earnings. Incidentally it seems as a deterrent to the locking up of

resources; but manifestly the simultaneous utilization of the great reserves of mineral deposits is impossible. These are held in trust for future generations. The ascertainment of their extent and richness, and their control by effective working organizations, is a distinct contribution to the welfare of the future."

### DEATH OF MR. C. G. WARNFORD-LOCK, M.I.M.M., F.G.S.

Charles George Warnford-Lock was the son of a mining engineer, and was born in Hampshire on September 9th, 1853.

He was educated at Cranleigh, and his first professional engagement was in the sulphur mines of Iceland. He was afterwards engaged in alluvial mining in Hungary, and later on held responsible positions as mine manager in the Black Hills of South Dakota and in New South Wales. It was in the latter country, in 1896, that he took charge of the Wentworth Gold Fields Proprietary Company's mines. While he was controlling affairs there a prolonged strike took place, and it was owing to his energy and determination that he was able to run the mines during the period of disturbance, and bring the strike to a satisfactory issue. Mr. Warnford-Lock also managed mines for the Bulawayo Exploration Company at Gwelo, Rhodesia; and for the Raud Gold Mining Syndicate in the Malay Peninsula. For some time he resided in Sydney, where he practised as a consulting mining engineer.

He was the author of several well-known works on mining and cognate subjects, of which the chief are: "Practical Gold Mining" (1889); "Mining and Ore Dressing Machinery" (1890); "Economic Mining" (1895); "Principles and Practice of Gold Milling" (1901), and "The Miner's Pocket Book," which ran into five editions, the last being published in 1907. In that year he also brought out his last work, "Mining in Malaya for Gold and Tin," the second edition of which has already been issued.

Mr. Warnford-Lock was one of the original members of the Institution of Mining and Metallurgy, and served on its council and on its various committees. He moreover contributed several papers on mining and metallurgical subjects to the transactions of the Institution, and always maintained a keen interest in its affairs and well-being.

He returned to Malaya in 1908, where he was engaged in inspecting and reporting on properties for various mining companies. An attack of ptomain poisoning in the autumn of last year seriously impaired his constitution, and he was compelled to take voyages to China and Ceylon to recuperate his health. These were unfortunately unavailing, for after eight weeks' severe illness he died at Bandarawella, Ceylon, on July 30th last.

# **FLOW SHEET OF THE GOLDFIELD CONSOLIDATED MINES COMPANY.**

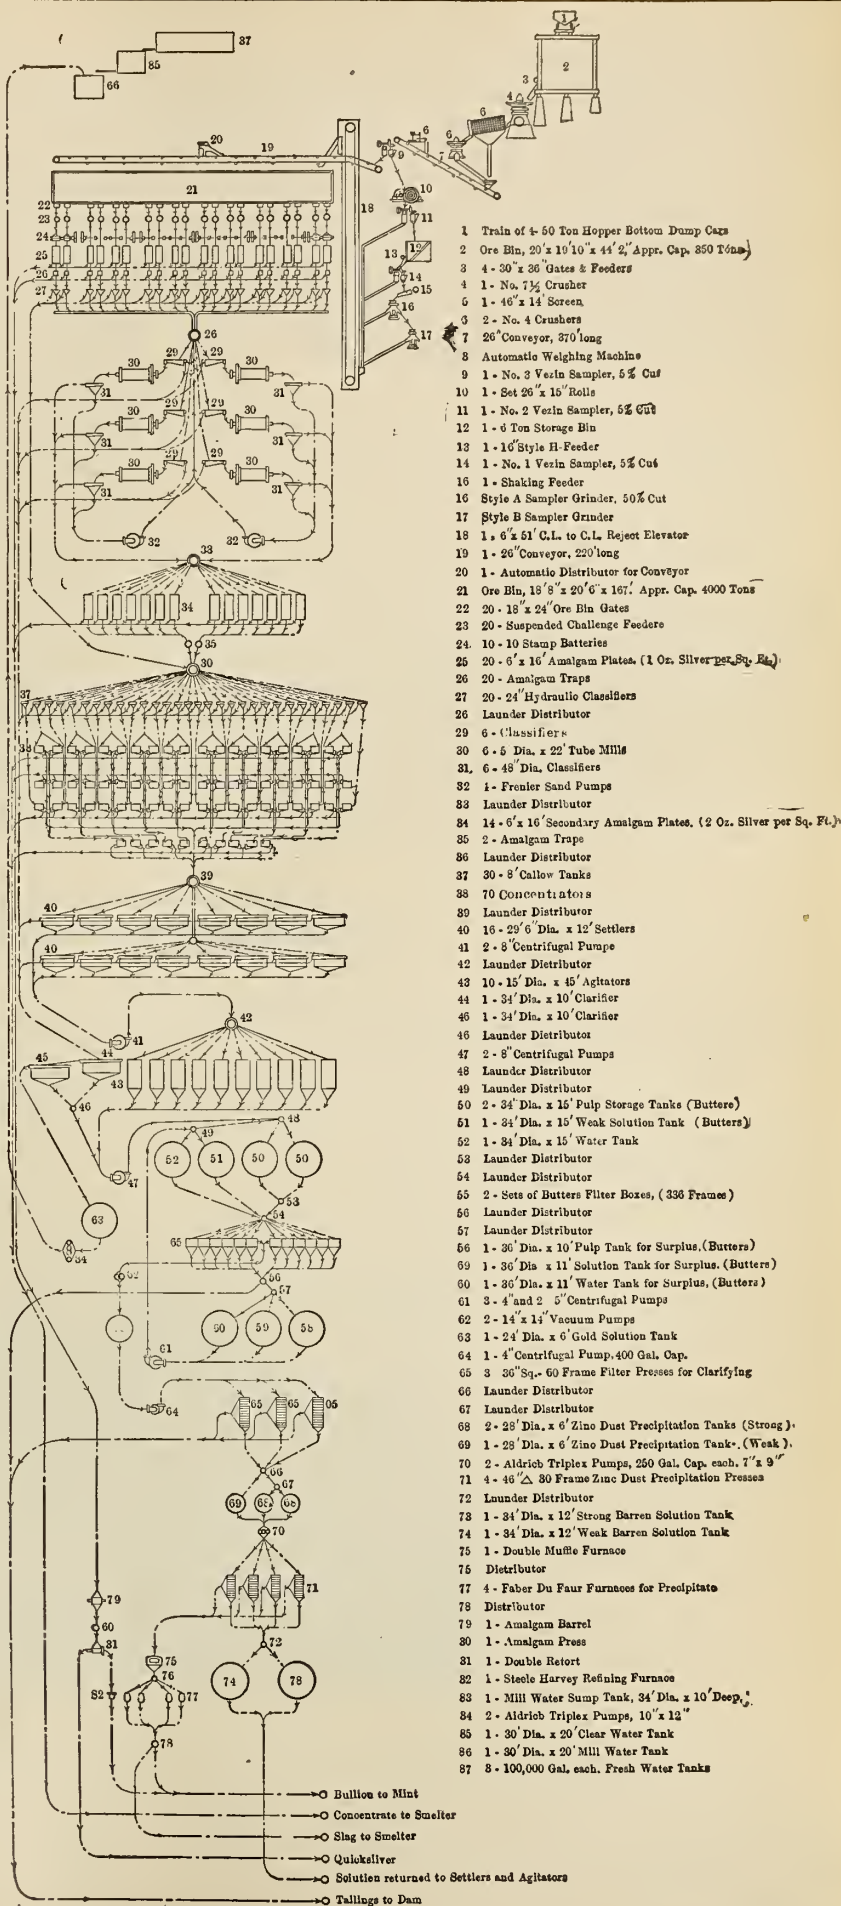

The Goldfield Consolidated Mines Company's 600-ton mill at Goldfield, Nevada, was designed and erected to remedy an intolerable condition. Before its erection, ore had to be shipped to outside points, and no ore running less than \$50 per ton could stand the charges imposed. The new mill starting upon \$50 ore, will soon treat \$30 ore. Ultimately the grade of the ore will be reduced to between \$10 and \$15. When this point is reached, practically everything between walls in the company's mines will be broken down and sent to the mill.

The mill site lies on the west slope of the foothills at the base of Columbia Mountain, near the Sandstorm claims, which were the first claims staked in the Goldfield camp. The company's mines are about a mile and a half southeast of the mill. Manager J. H. MacKenzie and his staff designed the mill; Francis L. Bosqui, metallurgical engineer for the company, was responsible for the cyanide end, and Grant B. Shipley, engineer of Allis-Chalmers Company, which furnished the machinery, designed the mechanical details of the entire plant.

The main building, built on a side hill, is of the usual terraced construction, and has four departments, all in one structure. The batteries occupy a section 50 ft. 6 in. wide by 210 ft. long; the tube mills a section 62 ft. wide by 210 ft. long; the concentrator section is 60 ft. wide by 266 ft. long; and the cyanide department is 222 ft. 6 in. wide by 294 ft. long. The difference in elevation between the first wall and the last wall is 132 ft. 1 in. Below this last level is sufficient fall to carry the tailings to the tailings dam in the desert below.

The mill building is entirely of steel construction, furnished and erected by the American Bridge Company of New York. There is between 500 and 600 tons of structural steel in the building exclusive of roofing and siding, which is of asbestos-protected corrugated metal.

It is impossible here to give further details concerning the construction of this phenomenal mill. The flow-sheet diagram that appears herewith shows fully the units that go to make up the equipment of this phenomenal plant, which is a monument to the engineering skill of its designers and to the efficiency of the manufacturers who supplied and installed the machinery.

### PERSONAL AND GENERAL.

Mr. Frederic Keffer has recently examined several Kamloops mining properties.

Mr. H. P. Davis, of Cobalt, has been ill in Toronto for some days. He is now on the road to recovery.

Mr. O. N. Scott has returned to Toronto after an extended visit to Cobalt and Gowganda, during which he conducted several examinations of mining properties.

Dr. W. G. Miller, Mr. J. B. Tyrrell, and Mr. Cyril Knight accompanied the visiting members of the British Association for the Advancement of Science to Winnipeg.

Mr. S. N. Graham, who for the last five years has been engaged in mining in Mexico, is at present in Kingston, Ont. Mr. Graham is a graduate of the Kingston School of Mining in both civil and mining engineering.

Mr. A. B. W. Hodges, general manager of the Granby Consolidated Mining and Smelting Company, sailed on August 26th from Vancouver for the Queen Charlotte Islands. Mr. Hodges is to inspect mining properties near Jedway, Lockport and Tasso Harbour.

Mr. R. J. McConnell, of the Geological Survey of Canada, has completed his work on Texada Island and is engaged in making an examination of the mining district in the Queen Charlotte Islands. This is the

first time in many years that a Survey official has visited these islands.

Mr. Charles Graham, one of the underground managers for the Western Fuel Company at Nanaimo, has been appointed mine manager for the Vermillion Forks Mining and Development Company, Princeton, Similkamen. He is a brother of Mr. Thomas Graham, of Nanaimo, General Superintendent of the Western Fuel Company.

Mr. Ernest Levy, of London, has been appointed to the position of manager of the Le Roi No. 2 mine at Rossland, made vacant by the resignation of Mr. Paul S. Couldrey, who recently accepted a position with the British Columbia Copper Company as superintendent of the Mother Lode mine at Greenwood. Mr. Levy, who is familiar with the properties of which he will have charge, having on several occasions filled the office during Mr. Couldrey's absence, is expected to arrive in Rossland in a few days.

Prof. R. C. Allen was selected August 9th to succeed Mr. Lane, whose resignation we announced in the July number, as State Geologist of Michigan.

He has been Assistant Professor of Economic Geology at the University of Michigan the past year, was a favorite pupil of Prof. Leith at Madison, and under him has done work on the iron ranges both of Northern Michigan and of Canada.

## INDUSTRIAL NOTES.

### LARGE ELECTRIC MINING HOIST WITH 500 H.P. Motor.

There was recently installed in the mine of the Washington Coal & Coke Company at Dawson, Pa., a large mine hoist with an electric motor which presents several features of considerable interest.

is reached near the top where the loaded cars are pulled in on a landing on a grade of about 6 per cent. and on a curve of 150 foot radius. The empty cars will be allowed to drift down the slope by gravity, controlled by a brake on the hoist drum.

The hoisting drum is six feet in diameter and five feet wide between flanges. It is fitted with a hand

The hoist is used to haul thirty-five mine cars, averaging 3,800 pounds each when loaded, up a maximum grade of 8 1-2 per cent., 8,000 feet long at a speed of 600 feet per minute. The loaded cars start at the bottom of the slope on a 4 per cent grade, which gradually increases until the maximum grade of 8 1-2 per cent.

brake on one end, and a hand operated friction clutch on the other end. The drum is of very heavy steel construction, with a 12-inch shaft. All the gears on the machine are cast steel with machine cut teeth, the main spur gear being 10-inch face and the motor gears 13-inch face.

The frame is made in sections for convenience in installing in the mine. The drum and large gears and the friction clutch parts are also made in two pieces for the same purpose.

The hoist is driven through a flexible coupling by a 500 H.P. direct current non-reversing compound-wound Westinghouse motor. It is controlled by a standard semi-automatic Westinghouse magnetically-controlled unit switch controller. These switches are operated from the controller shown in the illustration, the controller carrying only small currents, while the main motor current is handled by the magnetically operated switches, thus doing away with the difficulties from arching.

This controller has an accelerating relay which prevents the starting switches from closing too rapidly and thereby prevents too large starting currents. Thus the second switch cannot close until the current allowed to flow by the closing of the circuit has fallen to a predetermined value. As soon as this value is reached the second switch closes thereby short-circuiting a resistance section and the current rises, but the third switch cannot close until the current has again fallen to the predetermined value. This not only prevents injury to the motor from careless handling during acceleration, but also insures the most rapid starting possible.

The controller also has a safety relay which opens the resistance switches in cases of excessive overload, and thereby protects the motor while running. If this relay operates while the motor is running, the motor

does not stop but is automatically brought up to its full speed again. This is a particularly valuable feature in an installation of this kind where the cars may strike some obstruction, as it affords perfect protection to the apparatus.

When it is remembered that this hoist is installed some 800 feet below the surface of the ground, the advantages of the electric transmission of power are evident. In no other way could this large amount of power be transmitted as economically, or as easily.

The hoist was supplied by the Connellsville Manufacturing and Mine Supply Company.

### THE LONGWALL SYSTEM OF MINING.

In the case of the flat reefs in the Far Eastern Rand the longwall system of mining has been adopted, because it reduces mineral losses to a minimum and affords better facilities for the application of mechanical power through permitting a continuous working face, extending over many hundreds of feet in length and to allowing the level to be driven 500 feet apart. This will simplify the working. This class of mining is much more prevalent in the coal mines of the Continent than in this country in consequence of the flatness of the seams. The driving of levels so far apart is a great saving, as in steep angles of dip the levels are made 100 feet instead of 500 feet apart.

## CORRESPONDENCE.

To the Editor of The Canadian Mining Journal,

Sir,—I have read with much interest Dr. Ledoux's article on "The Sampling of Cobalt Ores," which appeared in your issue of July 1st and on which you specially invite discussion.

The fact that Messrs. Ledoux & Co. consider that the errors of any system of mechanical sampling on rich Cobalt ores are of sufficient magnitude to warrant the laborious and costly hand sampling method now in use in their works, while mechanical sampling is employed on the same class of ores at Copper Cliff, Deloro and Denver, surely proves that discussion is likely to be both interesting and valuable.

The present practice of Messrs. Ledoux & Co. reduces the labour and cost of their former methods very considerably with, to my mind, no sacrifice in accuracy; for, though four samples, each reduced from the original, should theoretically agree with each other more closely in assay value than samples reduced from four quarters of a well mixed whole, the average value of the latter four samples should be at least as accurate as the average of the former. This principle, which is apparently admitted by Messrs. Ledoux & Co., since they have adopted it in their latest practice, is an important one.

Dr. Ledoux states that one of the two chief objections to automatic sampling devices is that they "do

not admit of taking more than one sample of the whole lot starting practically from the beginning each time."

Though this is true of the single samplers at present in general use, in mechanical sampling plants in most districts, double samplers, giving two separate samples of the whole, have for some time been in the market, and it would not be a difficult matter to make samplers, which would give three or four such samples if desired.

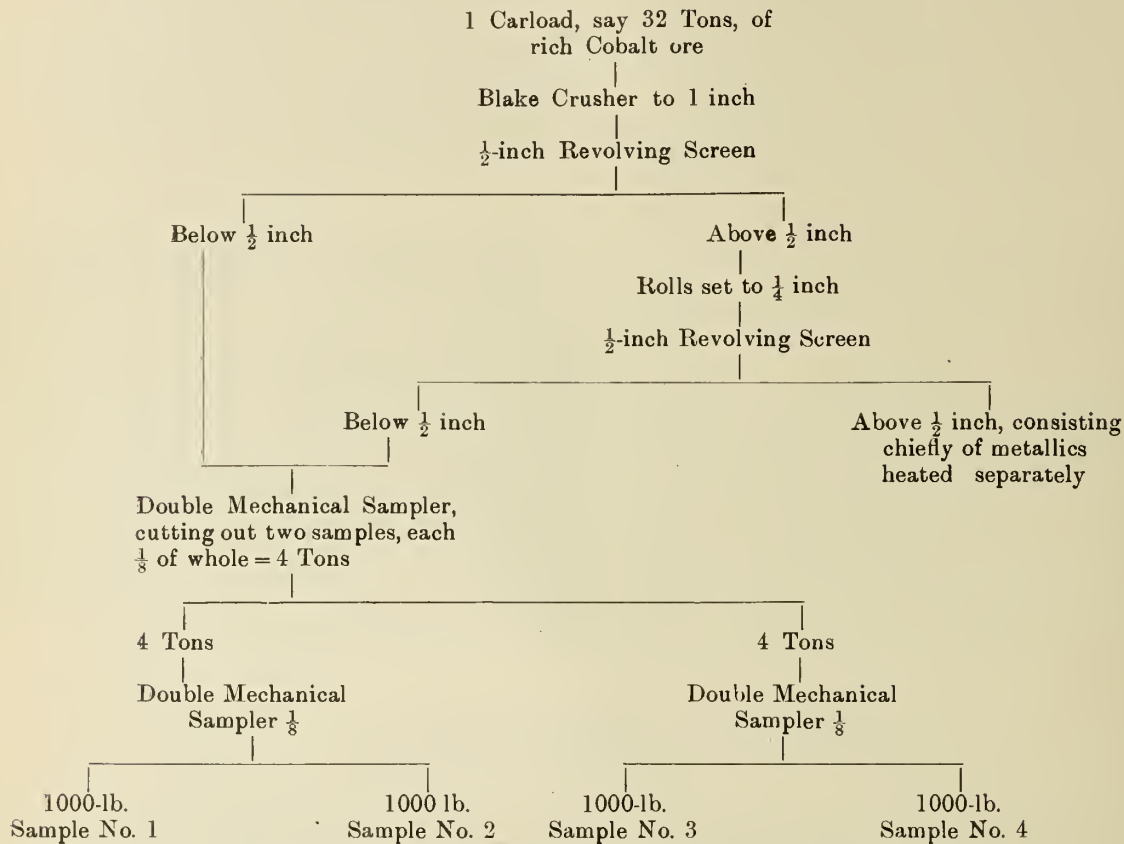

Now it is apparently admitted, according to Dr. Ledoux's article, since this is not one of the objections raised, that mechanical samplers can in one operation cut out as fair a sample, up to a certain point, as can be done by the successive coning and quartering by hand to the same fraction. A series of experiments to settle the proportion, which could thus be cut out as accurately as by hand on the same material would be worth making.

In the proposed sampling plant below I have assumed that one-eighth is a safe proportion to cut out in one stage.

In regard to the objection that there is a "possibility that in grinding in a ball mill or other similar device there may be a mechanical concentration in the mill"—this there undoubtedly is, with the result that the last ton or so is not only enriched but gets increasingly richer toward the end. There seems, however,

no reason to suppose that any greater error should be introduced in sampling this than in sampling the bulk of the ore, which runs through it under exactly the same conditions.

This possible error, however, could be eliminated by crushing by the same or similar means to those adopted by Messrs. Ledoux & Co. in hand sampling, in some such way as outlined below.

Continue as in latest method in use in Messrs. Ledoux & Co.'s works.

An economy in capital outlay could be effected, where speed in sampling was not important, by receiving the 4-ton samples in separate bins, from which they could each in turn be returned to the first sampler.

The above scheme of sampling could doubtless be

improved; but will serve to show the directions in which the laborious and costly hand sampling methods under discussion could, in my opinion, be reduced in cost and labour without sacrifice in accuracy.

D. B. Langford.

## SPECIAL CORRESPONDENCE

### NOVA SCOTIA.

The Dupes of the U. M. W. A. in Nova Scotia.—The true inwardness of the U. M. W. A. trouble in Nova Scotia has been overshadowed and befogged by a multitude of side issues, intelligible only to the initiated. With a few commendable exceptions, the newspapers have been unable to disassociate their political predilections from the real points at issue. The "Montreal Gazette" recently remarked: "Politics have entered into

the U. M. W. A. situation in a manner that no one outside of Nova Scotia can understand." It may be added there are people in Nova Scotia also who cannot sight the political bearings of the present trouble, for the ways of the politician are dark and tortuous, and do not invite the closest inspection. Be that as it may, there is one fact that emerges clearly and more clearly from the mists of misrepresentation, namely, that the miners of Nova Scotia who have listened to the leaders of the U. M. W.

of America have been wantonly, wickedly and most cruelly duped. The present condition of the followers of the U. M. W. is not without a certain irony, but of the grimmest, and not to be compared with what is to follow. The victims of the glaring lies, the naked and unashamed mendacity of the salaried American strike-breeders have this coming winter to face bitter adversity and penury, aggravated by the knowledge that the workers of this deception will not share in nor suffer from the certain harvest of their deceit, and by the further knowledge that their fellows who refused to listen to the orators of the piratical U. M. W. A. and persisted in remaining at work as advised by their Canadian officers, have been richly justified in their course.

There is one word only which is strictly applicable to the actions of the U. M. W. leaders in Nova Scotia. They have acted wantonly. Apart from the unbelievable mendacity of these men, which is their outstanding characteristic, their campaign has been conducted with such an utter lack of common-sense, with so palpable a disregard for the welfare of our industries and our Canadian institutions and for any ultimate success which the U. M. W. might conceivably hope to attain by the use of those methods which are approved by honesty and public opinion, that we are perforce driven to the conclusion that these men are actuated solely by a desire to do damage, to run amuck. Their methods are iconoclastic, but without consuming zeal to condone them. Wicked and wanton destruction has marked the doings of the U. M. W. A. in Nova Scotia this summer. The leaders claim falsely that they were invited to Nova Scotia. If we may be pardoned the use of a metaphor, these self-invited guests have committed arson upon the dwelling of their host, and will depart hurriedly, leaving behind a scarred and roofless ruin and a beggared household.

There is a distinct difference between the situation at Springhill and that at Glace Bay. Strikes at Springhill have become a habit, and it is more than probable the thinking portion of the Provincial Workmen's Association regard the defection of the turbulent lodges of Springhill with great complacency. It is quite understandable that affiliation with so rampantly militant a union as the United Mine Workers would appeal to the Springhill men, particularly as the principles of international socialism have permeated Springhill for many years. After President Lewis' interview with Mr. Cowans and his strictures on the poorly balanced distribution of the mine labour there, added to the report of the Conciliation Board, it might have been thought that the leaders of the U. M. W. A. would for the sake of their union funds have tried to restrain the Springhill men from once more indulging in their annual diversion of a strike. Instead of this, however, they prepared a schedule of wages so grotesque in its demands that to read it is to laugh, and the resolution to strike was carried in the usual wanton manner of the U. M. W. by show of hands, and not by secret ballot. The ballot was carefully avoided by the leaders, as they knew it would have resulted very differently from the light-hearted show of hands. The leaders of the U. M. W. A. were under no misapprehension as to what would take place if a strike were called. They knew that recognition of the U. M. W. A. and acceptance of its demands were impossible, and knowing this, not only did they call the strike, but they even refused to allow the pumpmen and enginemen to work. The mine is indefinitely closed, a portion of it permanently abandoned. Is it to be wondered at if people conclude that the U. M. W. A. have no constructive policy, but are bent upon mischief for mischief's sake. No other conclusion can be arrived at.

As we have explained in previous correspondence, the desire of the U. M. W. A. to obtain control of the miners of Eastern Canada was based upon the fact that our coalfields here are the only serious competitor the bituminous mines of the United

States have to fear, and it is a natural and not unstatesmanlike policy on the part of the U. M. W. A. to endeavor to dominate the miners of Eastern Canada, for reasons that it is unnecessary to detail, so obvious are they. Unfortunately this policy has become confused with the personal ambitions of President Tom Lewis, whose office is open for re-election in January next. President Lewis' opponents are strong, and his re-election will be vigorously opposed. The addition of a solid Nova Scotian vote in his favour would ensure Lewis' election. Under the rules of the U. M. W. A. every person in receipt of strike pay is de facto a member. Up to the time of the Nova Scotian strikes the members of the U. M. W. A. were few, and fewer still had paid their dues. The strikes were called to hold together the membership of the U. M. W. in Nova Scotia. Had they not been called, the agitation, not being grounded in any real complaint, but being purely an artificial unrest skilfully fomented by salaried strike-breeders, would have died a natural death this summer, and President Lewis would have lost his votes. For this same reason it may be anticipated that the U. M. W. A. will not call off the Nova Scotia strikes, but will continue to dangle before the eyes of their poor dupes the same old illusions as long as they will serve their purpose. It is further not to be anticipated that the U. M. W. will trouble much about their Nova Scotian victims after next January, for the reasons following: Mr. Lewis' opponents are not in sympathy with the predatory and extra-national policy pursued by the present leaders, and in case they oust Mr. Lewis, they will speedily put a stop to the idiotic waste of their union's funds in Nova Scotia. If Mr. Lewis, by the help of the Nova Scotia strikers, manages to gain re-election, his ambitions will be gratified, for then he will be assured of a certain life-sinecure in the gift of the U. S. Government. Therefore, no matter how President Lewis' election goes, the Nova Scotian members of the U. M. W. A. will assume the unenviable position of the "poor relation," and will still further realize their folly.

The case of Dominion No. 1 colliery of the Dominion Coal Company presents an epitome of the piratical and intrusive policy of this foreign union, and illustrates very well their propensity to "butt in." Throughout this strike "Dominion"—as it is usually termed—has maintained an output of from 200 to 300 tons greater than it produced during the corresponding months of last year, and the workmen of that colliery have worked as they never did before. But in order to prevent forcible interference with the workmen by the idle U. M. W. A. pickets from other collieries the company were obliged to fence and guard the mine as rigidly as any of the other collieries, although practically every man was wishful and determined to continue at work. Dominion is the home of the grand Secretary of the Provincial Workmen's Association, and a stronghold of the P. W. A. For once a prophet has been honored in his own country, and Mr. Moffatt can withstand with equanimity the abominable torrent of lies and invective that his enemies have poured upon his devoted head, when he considers how loyally the members of the P. W. A. stood by him and their contract in his own village. But we may ask, is it right, is there any justification or reason why a coterie of salaried and trained breeders of discord, preachers of sedition and lawlessness from an alien country should be allowed to harry and persecute a body of Canadian workmen whose only request is to be allowed to mind their own business and manage their own affairs, and to put Canadian corporations to great expense for police protection, which the constituted authority of this amazingly democratic country was unable to afford. Where is the consistency between the Alien Labour Act of Canada and the toleration of a state of affairs such as we have referred to? If ever the term "conspiracy in unlawful restraint of trade" were justified, surely it is as applied to the unrestrained insauity which the U. M. W. A. is committing in our very midst.

One of the most unfortunate effects that have been brought

about by the discontent-mougers sent here from the United States is the disturbance of the pleasant relations which have hitherto existed between the management of the Dominion Coal Company and its workmen. We have previously emphasized the fact that the present strike is the first in the history of this company, the only one in sixteen years. Will it be believed that a part of the campaign to which the U. M. W. A. has devoted very large attention has been the destruction of these amicable relations and the inculcation of a spirit of disbelief and distrust in the good faith of the management. Before the strike the leaders of the U. M. W. A. gave publicity to a report that the policy of the general manager was not endorsed by the higher officers of the company, and that the general manager was in disfavour. The president of the company gave most emphatic denial to this report. Thereupon it was reported that the Board of Directors would veto the policy of the management, and these lies were given to the dupes with portentous solemnity at every lodge meeting. Now the U. M. W. have tried a fresh tack. They are gravely stating that the failure of Springhill to make its shareholders rich is due to gross mismanagement by the present responsible officers. The general manager of the Dominion Coal Company is now considered by the U. M. W. A. leaders as "no longer fit for his job." Such a statement from such a source discovers a desire on the part of the U. M. W. gentlemen to get rid of an opponent who has driven them hard, and is, in fact, a reluctant compliment. These tactics, of course, merely raise a smile among those who are competent to judge, but they serve their purpose among those who meekly swallow any lie proffered in the name of the U. M. W. The magnitude of the falsehoods set on foot by these walking delegates is only equalled by the incredible gullibility of their dupes.

The "Montreal Gazette," in commenting on the situation, remarks: "If the strikers have any wise friends, they will advise them to return to work as rapidly as they can. The U. M. W. organization is a reed that the longer they lean on it the worse it will pierce their hands."

The wisdom of this remark is undoubted, but it will not be heeded, and that is the pity of it. To satisfy one man's ambition, and to aid the political advancement of a few others, there has been brought about—we speak advisedly—a state of affairs more disastrous than any previous labour crisis in Nova Scotia. The loss of millions of dollars, of trade, of work, of homes and savings, or confidence, of reputation, all these have seemingly been necessary to teach us that Canadians can manage their own affairs without the assistance of American usurpers, and that all our elaborate legislation to protect Canadian industries against American interference is useless. We are a nice, quiet, long-suffering people in this Dominion, and the United States labour agitator is fully aware of the fact.

### QUEBEC.

**Sherbrooke.**—There is a deposit of tripoli in Stanstead County, from which many boxes have been filled and sold, as it is an excellent polishing powder, but the extent of it has not been ascertained.

The management of the Compton Gold Dredging Co. has apparently dug up another excuse for delay. When individual interests and private stock deals are allowed to interfere with a promotion, before it has fairly got its feet on the ground, it is mighty apt to be a good candidate for the slow race.

The variety of Quebec minerals shown at the Fair is a surprise to nearly all, and strangers wonder that so little development has been done in this province.

But many a promising prospect never gets beyond the promotion stage. Stupid incompetency, and consequent misstatements and perversion of simple things to cover the same, are

as bad in results as criminality, and even verge thereon. Yet to kick a certain small animal is a poor remedy for bad odor. One can only avoid intimate association after seeing its stripes.

The New York "expert" recently at Moe's River, after his employer's expressing his desire to have him meet Mr. Hardman, on being apprised of that gentleman's expected arrival, took the first train for home and mother. There's a large sized colored gentleman in the aggregation of fibrous fuel, and only his head is out of sight.

The introduction of a foreign element, with capital, is desirable, but the same without even credit, and with the capital yet to be made, is as deadly as the sleeping sickness.

The New York people who had an option on J. McDonald's copper property in Weedon have allowed it to expire, although the result of work done was more than gratifying. It is rumored that the same thing has resulted on Geo. E. Smith's mine at Memphremagog, although a new and probably permanent main vein has been uncovered, and the property is looking better than ever.

The bum brokers, etc., who, posing as mining men, reach out from New York or Montreal, with one hand to get a grip on a property, and with the other for an "angel" to put up the funds, are doing serious injury to the mining interests of the townships. Failing to secure the "angel" they invariably give the property a black eye, rather than confess their inability to make good. Sometimes they get an option, which is allowed to expire, then they banter for better terms. But don't imagine you can spot them at sight, or by Bradstreets. Like other confidence men, they put up a great front, and, having no scruples, get your confidence by pleasant manner, much promising and wheedling, until they are in a position to bully. Then the mask is dropped, sometimes a little prematurely, perhaps. The only safeguard is to insist on a substantial cash payment down. If your people won't or can't make that, cut them out.

Some specimens of bituminous coal from Stanstead were shown at the mineral exhibit at the Fair, said to be from several narrow seams. Following the usual line, the owner will probably put the price of \$100,000 or more on that farm, until he finds it mostly bituminous shale.

John E. Hardman, S.B., M.E., and a party came to Sherbrooke, Tuesday, the 7th, to inspect some local properties.

### ONTARIO.

**Gowganda.**—The wagon road from Elk Lake to Gowganda has been cleared and graded for ten miles. The work is making good headway, and it is hoped that the whole road will be completed and ready for traffic before winter. Over one hundred men are working at present.

The road from Bisco to Gowganda is already cut, and most of it is already cleared of bush and stumps.

Now that the fly season is over and the camp has been able to get down to work in earnest, many new veins have been uncovered. A new vein carrying native silver was found on the Ryan, Gowganda, while trenching recently.

Active prospecting work is now being carried on at the Hedges claim, which adjoins the Boyd-Gordon.

The Reeves-Dobie property now have their machinery installed. On their north claim three new veins have been uncovered carrying good silver values.

The Bonsall mine near Miller Lake has stopped all underground work, and the mine has been completely closed down, except for some surface trenching. It is said that the shut-down was caused by the ore pinching out.

On the Boyd-Gordon their No. 8 vein has been cut in the south cross-cut at a depth of 80 feet. The vein averages from

four to six inches wide, and carries native silver and smaltite right across.

The Morgan mine has been sinking on the big niccolite vein. Silver has been struck in the shaft at a depth of 25 feet.

Several new smaltite veins have been discovered recently on the Mann property. A new vein has been uncovered north of the original discovery of a vein averaging two inches wide, which is heavily shot through with native silver.

On the Morrison claim near Miller Lake active prospecting work has been carried on for some time. Seven silver-bearing veins have been uncovered. The most recent is a six-inch vein assaying from four to five thousand ounces per ton. A company known as the Northern Mining Company has recently been incorporated to develop and mine the claim.

On the Millerett mine, in the Miller Lake district, formerly the Blackburn, two shafts have been sunk and considerable open cutting and tunnelling done. The main shaft, sunk beside the principal vein, is down a distance of 80 feet, and No. 2 shaft is down 50 feet. About 200 feet of drifting has been done from both shafts. On the main surface vein 100 feet of open cutting has been done, followed by a tunnel 120 feet long, which follows the vein into the hillside. The company has commenced stopping on this vein. The Millerett property consists of 40 acres, and 65 men are employed, a portion of whom are doing trenching and surface work.

At the Big Six mine, not far from the Millerett, two shafts have been sunk for 50 and 65 feet respectively, and some drifting has been done from both. The ore is all being left in the stopes, but a considerable amount has been blocked out. The property consists of 160 acres, and 25 men are employed. At present no surface work is being done.

**Port Arthur.**—The furnace of the Atikokan Iron Company is now producing No. 1 iron steadily. The output is about 100 tons per day, and will be gradually increased. The ore-roasters are working efficiently, reducing the sulphur contents of the ore from about 2 per cent. to a figure that presents no difficulty from a fluxing point of view. The roasted ore averages about 61 per cent. iron. The coke ovens are on 72-hour coke, 30 ovens producing all the fuel now necessary. Six and a half tons are charged per oven, where formerly only  $4\frac{1}{2}$  to 5 tons were charged. The yield is 4 tons of coke per oven. One Covington coke-drawing machine, operated by two men, draws the thirty ovens. The total number of men employed at the ovens is 8, viz: Foreman, operator and helper on Covington machine, 2 back-scrappers, 2 chargers, 1 labourer to plaster doors and water coke. The drawing is usually completed by 2 o'clock. The saving in time and labour under the present arrangement is considerably more than 100 per cent.

A "Brown" hoist, with bucket and magnet attachment, is another labour-saving addition to the plant. With the bucket attachment cars can be loaded with limestone or ore with a minimum loss of time. The magnet attachment is used to handle and load pig iron. It lifts 20 to 30 pigs at a time, and in loading a car makes two trips per minute.

A slag-granulator is also installed. The granulated slag makes excellent ballast, and is much in demand.

**Cobalt.**—The Silver Cliff mine is putting in a 30-stamp concentrator to handle the large quantity of low-grade ore which they have on the dumps and in the stopes. The contract for the machinery was given to the Traylor Engineering Co. They have also purchased an electrically driven hoist.

Every once in a while reports are heard of new strikes on the Beaver. These strikes are simply chutes in the same vein. This vein is irregular, and the values pinch in and out.

There is a good deal of activity at Cobalt Lake owing to the fact that development on the vein discovered some time ago has

shown that it increases in width and values. When first discovered it was about 3 inches wide but now there is about 6 inches of high-grade ore.

In the dump of the La Rose, which is being treated by the Northern Customs Concentrator on a royalty basis, it is estimated that there are about 45,000 tons of ore, with a gross value of about 1,250,000 ounces. The profit accruing to the La Rose will be about \$330,000.

The development on the latest find on the Lawson has shown that it is one of the richest so far discovered. It has been uncovered for a distance of over 175 feet, and in one spot there is about 14 inches of high grade ore, and the wall rock is also well mineralized. The shaft sunk on the Keewatin vein has also been productive of very good results. On the surface there was only about one inch of ore, but in the bottom of the shaft, which is now down about 45 feet, there is a 6-inch vein of smaltite, carrying good values in silver.

Until further action is taken with regard to the Provincial mine, this property will rent their air to the Waldman claim in the Gillies Limit, and the Goulds Consolidated on Cart Lake. The Waldman now have their pipe line in, and are operating one drill. The Gould Consolidated have also connected up, as the Nipissing need all their air for their own use. The Waldman has lately installed a small boiler and hoist, and the work of sinking the shaft will be carried on rapidly. So far the development on this property has not been productive of very encouraging results, as the vein which showed such high values on the surface has changed to calcite, with a small stringer of cobalt, which carries but little silver at the bottom of the shaft.

A discovery of importance was made a short time ago at the North Cobalt mine, which is in the same vicinity as the Green-Meehan, Red Rock, Black Mining Co. and others. The North Cobalt Mining Co. commenced work in 1907, and sank on a small vein of calcite carrying practically no values. The shaft was sunk for a depth of about 60 feet, but as the results obtained were not very encouraging, work was stopped and the property lay idle until the Jacobs Exploration Co. took over a working option and obtained control. Machinery was installed and the work was persistently carried on. When the shaft was down 182 feet a cross-cut at the 170-foot level was started, and when the working was in about 40 feet the new vein was encountered. At this point there is about 20 inches of calcite carrying considerable silver.

The most important find of the season outside of Cobalt was made a short time ago on the Morrison claim, a property in the Le Roy group to the south of Miller Lake. A good deal of surface trenching has been done on the property, and several very promising leads were discovered. The one that has caused the excitement is a 6-inch vein carrying about four thousand ounce ore. A company known as the Northern Mining Co. was recently formed to develop the property, and it is financed by Montreal and Ottawa men.

Three new veins, known as Nos. 128, 130 and 131, have been found on the surface at the Nipissing. The first has been uncovered for about 60 feet, and shows one to two inches of high-grade ore. The second, which was found only a short distance from No. 129, varies in width from 2 to 6 inches of high-grade ore. No. 131 was found in the same locality.

The diamond drill which has been working on the Alexandra property to the south of the Cobalt Central, shows that the Huronian slates underlie the diabase at a depth of about 250 feet. At the present time the shaft is down about 160 feet, and when this has been timbered and put in shape, sinking will be continued to the 250-foot level. The good results obtained in this formation by the Cobalt Central have decided the management of the Alexandra to continue their development work to a greater depth.

The large number of new companies that have been formed recently to exploit properties in this district is a forerunner of the boom which will come this fall. Altogether new companies with a capitalization aggregating about twenty millions have been formed. The one of most interest to this district and the outside public is the Hudson Bay Mines, Ltd., with a capitalization of \$3,500,000. This company will take over the Coleman Township properties of the Temiskaming & Hudson Bay Mining Co.

Another drilling contest, open only to local teams, will be held on Labour Day, Sept. 6th. It is understood that Page and Pickens, of Globe, Arizona, who won the \$1,000 prize in the competition held August 19th, will give an exhibition. The work done by these men was a revelation to the local teams, and it is expected that the contest on Labour Day will be much improved in consequence of this.

At a point about 300 feet north of the first strike on the Foster another important discovery has been made. The vein has been uncovered for some distance, and shows a width of about 6 inches of high-grade ore. Considering the conditions of the lease which the argentum Mines Co. has on this property, it is doubtful if the Foster stockholders will benefit very much.

The Silver Lake Mining Co. at Silver Lake has let a contract for 1,500 feet of diamond drilling. The machine has been shipped in through Elk Lake, and been installed. This is the first diamond drill to be used in this section of the camp, and the knowledge of the formation which will result will be of great benefit to the surrounding properties.

It is reported that in the near future the Crown Reserve will commence the construction of a concentrator. There is a large amount of ore on the dump and in the stopes, but the main reason is the result that has been obtained in the recent development in the Keewatin formation. At a depth of 170 feet the conglomerate gave place to Keewatin, and although there was no great change in the value of the ore, the veins were found to be much more split up, and as a consequence mining operations result in the production of a much larger amount of low-grade than formerly. The east and west winzes have been connected at the 200-foot level, and a raise has been started to connect with the main shaft. It is expected that it will be completed in a short time. At the Imperial Crown, which is controlled by the Crown Reserve, the surface is being trenched in a very thorough manner. A force of men has been working all summer, and the property has been cut into 100-foot squares with trenches. Several veins of calcite carrying some silver values have been located. On one of these veins at the west side of the property a shaft is down about 40 feet. Another shaft will shortly be started on a vein near the Kerr Lake-Majestic line. A diamond drill is working to try and locate the underlying Huronian slates.

In the Latour Lake district discoveries of silver have recently been made on the Lang-Caswell property and the Wright claim. The former has the greatest amount of work done of any mine in this section. The No. 1 shaft is down 75 feet, and sinking is still in progress. The vein in the bottom of the shaft is about 6 inches in width, and carries considerable cobalt. The discovery on the Wright property consists of a calcite vein carrying a good deal of smaltite with values in silver. So far but little work has been done, a test pit on the vein having been sunk only about 6 feet.

It is reported that the White Reserve Co., in the Maple Mountain district, will make a shipment of high-grade ore in September. This company has been in a position to make shipments for some time, but it deferred sending any ore out until it was in a position to ship continuously. The machinery on the property has now been all installed.

During the month of August there were shipped from 18 mines 81 cars of ore, aggregating 2,6064 tons. This is slightly

behind the July output, which was 85 cars, amounting to 2,715 tons.

At the 60-foot level of the Nancy Helen work was recommenced a short time ago on a vein which had been for some time abandoned. The drift was continued only a few feet toward the southeast when the vein widened and good values were found. When the work was started there was only about one inch of barren calcite, but this developed into about 3 inches of high-grade ore with values in the wall rock.

Underground work will shortly be resumed at the Drummond mine, and the main shaft is now being pumped out. During the summer a large force of men has been engaged in surface trenching, and a shaft is now being sunk at the southwest corner near the Silver Cross property. During the last few months the Drummond has been making large shipments of low-grade ore to Trout Mills.

Progress is being made on the Trethewey mill, and in a few days the concrete foundations will be finished. The mill will have thirty stamps, and will be able to handle about 80 tons a day. In order to connect it with the shafts, a small electric tramway will be built. This mine has a large tonnage of milling ore on the dumps.

At the 300-foot level of the Temiskaming mine good ore is still being obtained, the vein running from 6 to 12 inches in width of smaltite ore, carrying high values in native silver. A considerable amount of drifting has been done on this level, and a cross-cut is being run to cut some of the other veins. When the drift on No. 4 vein reaches the shaft, another winze will be sunk to the 300-foot level, and when this has been done the main shaft will also be sunk and connected up with the winze. The building for the crushing end of the new mill is completed, and it is expected that the machinery will be on hand and installed in a short time. Foundations for the concentrating end, distant about 300 feet from the shaft, are nearly finished.

Conditions at the Kerr Lake mine are steadily improving, and the amount of ore in sight has greatly increased in the last few months. So far veins Nos. 3 and 7 have been the principal producers, and the latter has been developed by a shaft to a depth of 190 feet, and the ore in the bottom of the work is as good as ever, and runs about 3,000 ounces to the ton. On the No. 3 vein the shaft is down 350 feet, and a winze is being sunk from the sixth level. The ore runs over 4,000 ounces to the ton. During the past month two new high-grade veins have been located underground, one of them at a depth of 160 feet. Two surface veins have also been recently located, and these both show values of over 1,000 ounces. When the winze from the sixth level is completed, it will be down 400 feet, and will be the deepest working in the camp. It is said that the cash on hand and ore in transit amounts to about \$800,000.

The trial of Angus McKelvie, vice-president of the Temiskaming & Hudson Bay Mining Co., held in North Bay on Sept. 4th, resulted in his being honourably acquitted. Mr. McKelvie was charged with having bribed John Piche to induce him to leave the country, so that his evidence in a suit brought by the Attorney-General's Department of Ontario against the T. & H. B., affecting their title, could not be given. Piche was one of the original discoverers of the Hudson Bay mine, and it was stated that at the time the claims were staked, a legitimate discovery such as was required by law, had not been made, and as a consequence application was made to the Attorney-General to have the company's rights to the property set aside. When the case came up, Piche, who was one of the principal witnesses, had disappeared. He was arrested on his return to New Liskeard a short time ago, and subsequently Mr. McKelvie was also arrested. The evidence showed that the money which passed between the two men was in settlement of a claim made by Piche against the Hudson Bay Co., and had nothing to do with the Attorney-General's suit.

The Station Grounds Mining Co. are diamond drilling under Cobalt Square in an effort to locate a vein which is supposed to be running east and west underneath that section of the town. The drill is operating from the Coniagas property, and will be in their territory for about fifty feet before it crosses the line.

A considerable amount of work is being done at the Victoria mine, and recent developments on a contact vein between the Keewatin and diabase at the 200-foot level have resulted in the discovery of niccolite with some silver values.

At the south end of Cross Lake a good deal of work is being accomplished on several of the properties there. The Eastern Township, formerly known as the Old Chap, is sinking on a big calcite vein. The shaft is down about 75 feet, and the work is being carried on with a small steam plant until compressed air can be obtained from one of the companies now coming into Cobalt. At the Silver Cross a new headframe is being put up, and when this has been completed the shaft will be timbered and sinking continued. A considerable amount of surface trenching is also being done. On the Belmont a force of men is prospecting the property, and a large calcite vein has been located. This has been cut by trenches in several places, and varies in width up to a foot. The Silver Lode Company are working with a small steam plant, and have a shaft down over 100 feet. When the 150-foot level is reached, cross-cuts will be started to explore the surrounding country.

The McKinley-Darragh will not rebuild the headframe at the Savage, which was destroyed by fire some time ago. The new shaft will be sunk another fifty feet, and from that point will be connected with the underground workings of the old shaft at the 75-foot level. At the last meeting of the directors held in Toronto it was decided to build a new office, laboratory and re-house at the property.

The name of the Silver Cross Mining Co. has been changed to that of Silver Cross Mines, Ltd. Good progress is being made in sinking the new shaft at the Lumsden mine, which is situated close to the Rochester. Air to run two drills has been obtained from the Temiskaming, and as a consequence sinking is progressing much more rapidly. The shaft is down about 75 feet, and when the 100-foot level is reached a cross-cut will be run to cut the vein, which dipped from the shaft a short distance below the surface. After the vein has been tested sinking will be continued to the 200-foot level, and from this point the management expect to carry on a considerable amount of work. From the main shaft of the Pan Silver in the same locality a cross-cut is being driven under the lake, and some good indications have been discovered. At the Columbus mine a good deal of work is being done at the 250-foot level.

The Rochester mine has been shut down on account of there being no money with which to carry on the work. A plan for the reorganization of the company is already under way, and it is understood that the new capitalization will be two million dollars. Part of the extra million will be sold to raise sufficient money to carry on development.

At the Cobalt Central operations are under way to open up a new level. This work will be in the Huronian slates, the development of which has given such satisfactory results to the company. A short time ago about sixty men went out on strike, owing to dissatisfaction with the quality of the food provided by the company. The management expect to fill the places of the strikers in a few days.

Cobalt is suffering from an epidemic of typhoid fever, and at the present time there are over 100 cases in the hospital. The hospital is not large enough to accommodate the number of patients, and tents have been put up behind the hospital, and others will be put up on the Coniagas property in a few days.

A good deal of blame is attached to the town authorities on account of the poor sanitary conditions existing in the town. About five per cent. of the population is down with fever.

Things are picking up in the Gowganda district, and the chances are that this fall and the coming winter will see a large increase in the amount of work being done. Several good discoveries have been made lately, which have been largely responsible lately for the optimistic tone now prevailing. A short time ago a new vein was found on the Mann property, and has been traced for 500 feet. It has also been traced for about 100 feet on the Boyd-Gordon. It will average about 4 inches in width, and carries a considerable quantity of native silver. Sinking has been stopped in the shaft while it is being timbered. On the Millen property, which adjoins the Mann, a 1-inch vein of very high-grade ore has been found. The Bartlett mines have the most up-to-date plant in the district, and their shaft is down about 115 feet. At the 100-foot level a cross-cut is being run to catch the vein, which dipped from the shaft at a depth of about 40 feet. At the Blackburn mine, which is said to be the best property in the whole of the Gowganda district, there is a tunnel in 125 feet on a 2-inch vein of high-grade ore. A shaft was sunk a short distance away from the vein, which it cut at the bottom at a depth of 80 feet. So far no drifting has been done from the shaft, as they have been bothered with water, and have been handling about 20,000 gallons a day with the bucket.

#### BRITISH COLUMBIA.

**Rossland.**—At the Le Roi mine the initial diamond drill work in the big development plan has been contracted for and work begun. The contract was let to O. L. Wright & Co., an energetic diamond drill contracting firm who have done much work in this district and the Boundary. No time will now be lost, and the work of opening the main vein at the Le Roi for another thousand feet will be energetically executed. It is likely that the work will entail the sinking of the main shaft a few hundred feet more. By doing this and some drifting it is thought better results could be obtained with the diamond drill on certain portions of the vein to be prospected. The probabilities are that this work will open up large quantities of gold ore similar to the lenticular deposit of \$100 ore taken out of the 1,650 level of the mine shortly before the shut-down. Mr. A. G. Larson, who has been superintendent of the Le Roi for some years, is in charge of the new work, and if application and a keen sense of the order of things underground have anything to do with it the present work will surely result favourably. The business end of Le Roi affairs here has been handled for the past several years by Mr. W. S. Rugh, who as office manager has got things about the mine down to an economical basis, and if it were not for the handicap that was placed on this mine in the extravagant days of the past, there is little doubt but that it would be working as a paying mine to-day, but as it is, the old mine not only has to pay its own way, but must give tribute to an incubus of debt fastened to it in days when the business was not as economically handled as it is to-day. The men who are interested here, however, look for brighter things in the future, as they do not think that Mr. Carlyle would have recommended the expenditure of a million dollars in developing the lower levels of the Le Roi unless the chances were very good for opening up large bodies of good ore.

There has been a change of management at the Le Roi 2, Ltd., Mr. Paul S. Couldrey, who has so ably managed the property for the last six years, leaving Rossland to take a position with the B. C. Copper Co., Ltd. Mr. Couldrey will be superintendent of the Mother Lode mine at Greenwood, and will no doubt do the same good work in that camp that he has done here with the Josie mine. While Mr. Couldrey has been in charge of the Le Roi 2, Ltd., the company has paid from four to eight shillings per share in dividends, having already paid four shillings during the present calendar year. Mr. Couldrey will be succeeded by Mr. Ernest Levy, a gentleman who has

been in charge of the work here at Rossland at one or two different times, and who, therefore, is not a stranger to the peculiar conditions attached to mining in this camp, nor is he a stranger to the Josie property and the methods of working it that have paid so well during late years. So, taking things as they look now, it is not likely there will be any radical change in the policy of the Le Roi 2, Ltd., at present, but that, with a few possible small changes, things will run along as they have for some time, at least.

Shipments from the Centre Star group keep up near the record mark for the year, and things are running along in an evenly balanced tenor. The mine is being run on an economical basis, mining, development and expansion being handled in a conservative yet aggressive manner by Mr. R. H. Stewart, the chief engineer, of the Consolidated M. & S. Co. of Canada. This company has recently acquired the Black Jack claim in Wellington camp, where the B. C. Copper Co. is opening up some new claims, and it is rumored that the Consolidated is behind the work being done on the No. 7 in Central camp, where the B. C. Copper Co. also has a good property with a lot of ore blocked out ready for shipment. A spur of the Canadian Pacific Railway will be run to tap these two camps in the near future, much of the preliminary work having already been done. The expansive policy of the Consolidated will assure a steady supply of ore for the Trail smelter and refinery, which is being gradually enlarged as the operations of the company increase.

**Phoenix.**—It is still anybody's guess how the shuffle of New Dominion Copper affairs will turn out, although it is practically assured a merger has been arranged, all but the final details. During the past week Mr. John Seward, of New York, arrived in the Boundary to take charge of the property of the New Dominion Copper Co. Mr. Seward expects to go over the ground carefully and consider just what policy can be adopted to place the property on a proper working basis. There is little doubt but that work will be resumed at the mines in a very short time, probably by the first of September, but it will likely be in the form of development for a short while, and the likelihood of the Boundary Falls smelter being blown in is small, although there is a possibility of the B. C. Copper Co. smelter having all it can do to handle the ore from its own mines, after the railway taps its Wellington and Central properties, so that the rumor that the New Dominion ore would be smelted at Greenwood may not mean that it will be smelted there permanently; that is, unless the hinted merger is consummated and the smelter at Greenwood is enlarged to take a greater tonnage. Of course, one of the furnaces is now being enlarged with a view to heavier operation, and it is no doubt the intention to enlarge the other two smelters in turn. One thing everyone here seems satisfied upon, and that is the mines will be worked, and that means progress for the district at large. What the details of the organization are will be of little moment so long as the mines and smelters are in operation and paying a profit.

A visit was paid to the property of the Dominion Copper Co. last week by B. W. Lincoln, of New York, who represents \$300,000 in stocks and bonds of dissenting shareholders in the old Dominion Copper Co. Mr. Lincoln says that his visit to the mines and to the coast is in connection with a plan he has in mind for obtaining from the new company certain rights which he thinks the old shareholders are entitled to.

The Snowshoe mine of the Consolidated broke another record for the week ending August 21st, shipping 4,430 tons to the smelter at Trail, B.C.

It is now authentically announced that the deal for the Nickel Plate mine of Hedley has been consummated. The Exploration Syndicate, behind which stand big Wall Street capitalists, has paid nearly one million dollars for the property. The property is now equipped with a 40-stamp mill and good mining equipment, but it is the intention of the new purchasers to augment both the milling and mining plants, and to work the property on a large scale. M. K. Rodgers, a local mining man of note, who has great faith in the Nickel Plate, and who was the one who brought this property to the attention of the late Marcus Daly, negotiated the sale. It is stated that Frank A. Ross, who has been acting as manager of the Nickel Plate for the past few years, will continue in that office under the new regime.

**Nelson.**—The hoodoo that follows the Silver King property at Nelson put in its appearance again the other day, when a fire destroyed the surface workings and part of the tramway, causing a cessation of work. It is too bad that the fire should occur at this time when things were just getting in good running order. This accident is almost enough to cause the lessees to wait until next spring before starting in again; although it is announced that the buildings will be renewed.

Another property has been acquired by J. S. Airheart, who is now successfully working the Highland-Buckeye property at Ainsworth. This recently acquired property is the United mine, which is situated not far from the Highland-Buckeye. The Highland mill is amply large enough, and will treat the ore from the United, as well as the others.

The air is full of the news of the acquirement of mining property in this district by capitalists from various parts of the country, and not only is the property changing hands, but work is being started. The large mines, which are the backbone of the district, are preparing for wider scope in the work of the near future, and are week after week breaking the preceding records of ore shipments for the year, so that it looks as though the next year or eighteen months, at least, would see a wonderful change in mining in this locality. Things may quieten a little this winter, but there is little doubt that next year will be a hummer, always provided we are bothered or hindered by strikes or car and fuel shortages, which is not likely, as conditions are fairly settled for a while anyway.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Amherst.**—The Maritime Coal, Railway and Power Company, head-quarters at Montreal, with principal mine at Joggins, Cumberland County, N.S., completed the installation of an endless haulage system on Sept. 2nd. This is a great improvement in facilitating the raising of coal from the pit. The output of No. 7 slope has already been increased from 250 to 1,500 tons,

and the new haulage system will increase the mine output six times the output under the old haulage. Senator Mitchell is president of the company. There is no sign of labor trouble at this colliery.

**Sydney Mines.**—The open-hearth furnaces of the N. S. Steel and Coal Company, which were closed for repairs during August, are now in commission once more.

**Sydney, Aug. 28.**—The Colonial Coal Company, which has re-opened the old Toronto mine at Little Bras D'Or, which has been closed down for over thirty years, announces that it will be shipping coal by the middle of September.

#### ONTARIO.

**Cobalt.**—A new vein was cut on the Foster recently, the second in three weeks. It is two inches wide and is mainly native silver.

**Cobalt.**—The Nova Scotia mill, it is estimated, will cost about \$100,000. It is claimed that, given a capacity of 75 tons per day, there is sufficient milling ore in sight to keep the mill running for four years.

**Port Arthur.**—The Dominion Bessemer Co., owning 6,000 acres of iron ore lands, 22 miles east of Port Arthur, and near Beck Siding on the C.P.R., is making arrangements for shipping ore. Mr. F. W. Goodrich is in charge of operations.

**South Lorrain.**—The first considerable shipment of high-grade ore from South Lorrain camp has just been completed. The Wettlaufer mine has just finished loading a car of firsts that will go by C. P. R. to Perth Amboy, from Mattawa and Prescott, the mine finding it to their advantage to ship down Lake Temiskaming and by C. P. R. rather than to Haileybury and over the T. & N. O. The car was of 50,900 pounds, and it is valued at \$25,959. The ore is stated to be 2,800 ounces. The ore was taken from the Wettlaufer in wagon for two and a half miles to 66, where it was put on scows and taken down the lake for transshipment to the C. P. R.

#### QUEBEC.

**Quebec.**—It is announced that the Provincial Government has determined to impose a royalty upon asbestos. What the new impost will amount to is not yet known.

**Montreal.**—The Amalgamated Asbestos Corporation, Limited, has decided to increase its rolling stock slightly. At the King Mine, Thetford Mines, and the British-Canadian Mines at Black Lake the rolling stock consists of eight locomotives and 220 cars. Two new saddle-tank locomotives have been ordered for the Beaver and Standard properties.

#### BRITISH COLUMBIA.

**Hedley.**—Under its new management the Nickel Plate mine is to be developed extensively. The mine has already yielded \$2,000,000 in gold.

**Rossland.**—On the Hattie Brown the project of diamond drilling has been temporarily abandoned, and, instead of doing this, cross-cuts are to be run from the bottom of the shaft in a northerly and southerly direction clear across the property for the purpose of tapping several ledges that run through the claim. The work of driving the cross-cuts will be let by contract.

The Le Roi Mining Co., Ltd., issued from its London office, on August 10th, the following notice to its shareholders: "The directors beg to inform the shareholders that the managing director has returned to British Columbia, and that the scheme of exploration and development outlined by W. A. Carlyle, the consulting engineer, is now being carried out at the mine. Any development of importance during the progress of this work will at once be communicated to the shareholders. Harold A. Wesson, secretary."

**Rossland.**—The Sappho group of five claims, two miles from Midway, has been bonded to the B. C. Copper Co. for \$20,000. The bond extends over 18 months.

**Rossland.**—Contracts for extensive diamond drilling on the Le Roi mine have been awarded to O. L. Knight & Co.

**Hedley.**—The Daly Reduction Company's mill and the Nickel Plate mine have been sold for a large figure. It is stated that J. J. Hill is interested in the transaction.

**Silverton.**—At the Vancouver mine the Van Roi Mining Co. are operating three shifts. In all, 70 men are employed. The concentrator will soon be working to full capacity.

**Phoenix.**—The Murex magnetic process is to be tried on the ores of the Vancouver mine at Silverton.

**Fernie, Aug. 31.**—A new town, to be called Carbondale, has been platted at a point on the railroad where the McGillivray Creek Coal & Coke Company are installing their plant, and houses will be built for the employees on easy terms by the Townsite Company.

Rumor has it that the entire output of this coal mine has been contracted for by one of the new transcontinental railroads.

This company's holdings represent a total of 2,600 acres of coal land, lying directly north of the Canadian Railway tracts. The property is estimated by engineers to contain a large tonnage of coal. The machinery is fast being installed by the McGillivray Creek people, and construction of coke ovens will begin early this autumn.

## MINING NEWS OF THE WORLD.

#### GREAT BRITAIN.

The Scottish coal market was at least fairly active throughout the first three weeks of August. Complaints are coming in from coal miners, to the effect that they cannot obtain sufficient employment to enable them to earn the minimum day's wage, 6 shillings.

At a conference of labour delegates representing the twenty colliery districts of Mid-Lothian and Haddingtonshire, held on August 14th, at Dalkeith, Secretary Brown stated that securing the 6s. minimum wage was one of the greatest events in the

history of the Scottish coal trade. He declared that this was but a step towards securing a rate of 1 shilling per hour.

#### SOUTH AFRICA.

Under the supervision of Mr. R. B. Ballantine, the inventor and patentee of the process, the South African Cyanide Company is carrying on experimental work with a view to establishing a manufactory in Johannesburg. Mr. Ballantine's methods have been much criticized.

## AUSTRALIA.

The production of coal in Australia for the year 1907 has just been published. The total tonnage was 9,681,095 tons, valued at £3,302,974. New South Wales was incomparably the largest producer. Its output was 8,657,924 tons. South Australia furnished no coal. The total exports amounted to 5,748,507 tons, valued at £2,662,218. In 1857, the average value of Australian coal was 11s. 10d. Rising in the following year to 15s., the price declined steadily, until in 1871 it stood at 7s. After various fluctuations, ranging from 5s. 4d. to 12s., the average price in 1907 settled at 6s. 3d., although the actual prices current in individual states varied greatly.

## UNITED STATES.

According to the official figures of the Coalinga Oil Producers' Agency, California produced 5,100,000 barrels of oil during July; 477 producing wells contributed to this total. There were 112 well drilling, and 47 new rigs being erected.

Electric power is to be introduced into the mines of Butte, Montana. It is expected that this will bring costs of production down by one-third of a cent per pound. Fuel and supplies have to be hauled uphill for several miles at some of the mines. The saving in these instances will be marked.

Indiana coal production is looking up. The domestic demand is strong. Many of the mines are working full time.

At the Copper Queen, Bisbee, Arizona, a new precipitating plant has been erected. Wooden pegs have been substituted for nails. Nails were used in the former outfit, but their corrosion caused the collapse of the plant. The plant is designed for the recovery of copper from the mine waters by precipitation by scrap iron.

## Company Notes.

On September 1st the directors of the Dominion Iron & Steel Company declared a dividend of 7 per cent. on the preferred stock. This is payable October 1st. President Plummer pointed out that this was to be paid out of earnings, as no final settlement had yet been reached with the Dominion Coal Company. There still remains 28 per cent. due on the preferred stock.

## KERR LAKE AUGUST REPORT.

The report of the Kerr Lake Mining Company shows its financial condition as of August 25 is as follows: Cash on hand, \$380,600; 95 per cent. of estimated value of silver contents for shipment of ore delivered but not settled for, 331,579 ounces; 95 per cent. of estimated contents of shipment of ore in transit, on hand, 20,000 pounds at 2,000 ounces to 336,500 ounces; 97 per cent. of vein 7 ore ton 19,000 ounces; vein 3 ore on hand, 20,000 pounds, 3,000 ounces, 28,500 ounces; total, 715,579 ounces, at 50 cents, \$637,780; total, \$728,479.

A statement issued by the Empire Zinc Company, of Denver, Co., shows that of 38 cars of Lucky Jim (Kaslo, B.C.) ore shipped to that company's plant, the lowest value per ton was \$26.56 and the highest \$32.33.

The highest total value of the ore per car was \$1,407.13 and the lowest was \$778.73.

The highest amount of freight per car was \$391.60, and the lowest \$264.

The highest amount received by the mining company per car was \$1,014.65, and the lowest \$514.73.

The net value of the 38 cars was \$25,152.11, and the average value per car was \$635.58.

## STATISTICS AND RETURNS.

The official estimate of the Dominion Coal Company's output for Saturday is 9,061 tons, made up of 6,073 tons from the mines, and 2,988 tons from the banking stations.

## COBALT ORE SHIPMENTS.

There were eight shippers among the Cobalt mines last week, but the figures are not as lucid as they might be, one shipment of 636,410 pounds of ore being credited to the Carnegie Company, a smelting company in Pennsylvania, to whom the ore was sent instead of to the mine producing the ore. Shipments for the week and year (in pounds of ore) are:—

|                            | Week<br>Aug. 30. | Year<br>to date. |
|----------------------------|------------------|------------------|
| Buffalo . . . . .          |                  | 791,028          |

| Muggsley Consolidated . . . . .    | 72,900            |

## COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt camp for the week ending September 4, and those from January 1, 1909, to date:—

|                            | Since<br>Sept. 4.<br>Ore in lbs. | Jan. 1.<br>Ore in lbs. |
|----------------------------|----------------------------------|------------------------|
| Buffalo . . . . .          | 41,640                           | 832,668                |
| Carnegie . . . . .         |                                  | 63,410                 |
| Chambers-Ferland . . . . . |                                  | 961,010                |
| City of Cobalt . . . . .   | 40,000                           | 1,042,522              |
| Cobalt Central . . . . .   |                                  | 558,784                |
| Cobalt Lake . . . . .      |                                  | 79,960                 |
| Coniagas . . . . .         | 110,170                          | 1,153,485              |
| Crown Reserve . . . . .    | 60,730                           | 4,243,449              |

|                                    |                   |
|------------------------------------|-------------------|
| Drummond . . . . .                 | 920,000           |
| Kerr Lake . . . . .                | 60,130 1,482,156  |
| King Edward . . . . .              | 183,740           |
| La Rose . . . . .                  | 390,500 8,764,733 |
| McKinley-Darragh . . . . .         | 104,760 1,383,296 |
| Nipissing . . . . .                | 458,480 9,291,243 |
| Nova Scotia . . . . .              | 480,810           |
| Nancy Helen . . . . .              | 83,400            |
| Peterson Lake . . . . .            | 42,930 324,040    |
| O'Brien . . . . .                  | 71,700 1,831,102  |
| Right of Way . . . . .             | 2,154,891         |
| Silver Queen . . . . .             | 598,395           |
| Silver Cliff . . . . .             | 123,820           |
| Temiskaming . . . . .              | 1,506,060         |
| Trethewey . . . . .                | 1,362,698         |
| Temiskaming & Hudson Bay . . . . . | 1,106,260         |
| Muggley Consolidated . . . . .     | 72,900            |

Ore shipments to Sept. 4 from Jan. 1 are 40,604,832 pounds, or 20,302 tons. Total shipments for week ending Sept. 4 are 381,040 pounds, or 690 tons.

#### BRITISH COLUMBIA ORE SHIPMENTS.

Nelson, Aug. 21.—Appended are the ore shipments and smelter receipts in detail for the past week and year to date:—

##### Ore Shipments.

| Boundary—             | Week.  | Year.   |
|-----------------------|--------|---------|
| Granby . . . . .      | 19,592 | 624,731 |
| Snowshoe . . . . .    | 3,583  | 82,226  |
| Mother Lode . . . . . | 6,840  | 155,396 |
| Other mines . . . . . |        | 2,122   |
| Total . . . . .       | 20,015 | 864,465 |

##### Rossland—

|                                 |       |         |
|---------------------------------|-------|---------|
| Centre Star . . . . .           | 3,731 | 111,807 |
| Le Roi No. 2 . . . . .          | 712   | 19,863  |
| Le Roi No. 2 (milled) . . . . . | 260   | 19,863  |
| Other mines . . . . .           |       | 9,561   |

Total . . . . . 4,703 139,651

##### Slocan-Kootenay—

|                                    |     |        |
|------------------------------------|-----|--------|
| Queen (milled) . . . . .           | 420 | 13,650 |
| Granite Poorman (milled) . . . . . | 250 | 8,100  |
| Whitewater Deep (milled) . . . . . | 700 | 22,900 |
| Kootenay Bell (milled) . . . . .   | 70  | 2,280  |
| Second Relief (milled) . . . . .   | 145 | 4,715  |
| Nugget (milled) . . . . .          | 110 | 3,580  |
| Bluebell (milled) . . . . .        | 900 | 29,300 |
| St. Eugene . . . . .               | 252 | 13,731 |
| Silver King . . . . .              | 229 | 2,521  |
| Van Roi . . . . .                  | 83  | 514    |
| Bluebell . . . . .                 | 55  | 3,177  |
| Second Relief . . . . .            | 19  | 239    |
| Wellington . . . . .               | 9   | 29     |
| Eastmount . . . . .                | 24  | 24     |
| Ferguson . . . . .                 | 67  | 98     |
| Emerald (Iron Mt.) . . . . .       | 36  | 36     |

| Other mines . . . . .              |       | 12,922  |

Total . . . . . 3,533 123,126

The total shipments for the week were 37,666 tons, and for the year to date, 1,171,175 tons.

##### Smelter Receipts.

|                                       | Week.  | Year.   |
|---------------------------------------|--------|---------|
| Granby, Grand Forks . . . . .         | 18,688 | 642,869 |
| Consolidated, Trail . . . . .         | 8,741  | 256,987 |
| B. C. Copper Co., Greenwood . . . . . | 7,182  | 164,061 |
| Le Roi, Northport . . . . .           |        | 12,761  |

Total . . . . . 34,611 1,077,678

The total output of gold from Rhodesia for the month of July is cabled as 53,511 ozs., valued at £225,234, as against 51,78 ozs., valued at £217,600, in the previous month. This is an increase on the month of £7,634. There were 225 gold producers last month. The output of other minerals for last month was: Silver, 23,341 ozs.; lead, 92 tons; coal, 15,113 tons; copper, 7 tons; chrome ore, 2,240 tons, asbestos, 25 tons.

### PIG IRON PRODUCTION.

Ten-year totals (tons of 2,240 lbs.):—

|               |             |
|---------------|-------------|
| 1868-77 ..... | 19,984,735  |
| 1878-87 ..... | 42,484,217  |
| 1888-97 ..... | 82,236,958  |
| 1898-07 ..... | 181,470,757 |

Annual totals:—

|            |            |
|------------|------------|
| 1901 ..... | 15,878,354 |
| 1902 ..... | 17,821,307 |
| 1903 ..... | 18,009,252 |
| 1904 ..... | 16,497,033 |
| 1905 ..... | 22,992,380 |
| 1906 ..... | 25,307,191 |
| 1907 ..... | 25,781,361 |
| 1908 ..... | 15,936,018 |

Annual rate during

|                                             |            |
|---------------------------------------------|------------|
| First half, 1908 .....                      | 13,850,000 |
| Second half, 1908 .....                     | 17,900,000 |
| January, 1909 .....                         | 21,508,000 |
| February .....                              | 22,600,000 |
| March .....                                 | 21,963,000 |
| April .....                                 | 21,500,000 |
| May .....                                   | 22,518,000 |
| June .....                                  | 23,835,000 |
| July .....                                  | 25,087,000 |
| Prospect for 1909, continuing July rate.... | 23,670,000 |

### METAL STATISTICS.

The statistics formerly compiled by the Metallurgische Gesellschaft, of Frankfort-on-Main, now issued jointly by the Bergwerks and Metallbank and the Metallgesellschaft, give the world's output of the four leading metals for the last three years, as follows, in metric tons:—

|               | 1906.   | 1907.   | 1908.     |
|---------------|---------|---------|-----------|
| Lead .....    | 973,100 | 984,300 | 1,052,500 |
| Copper .....  | 717,800 | 703,000 | 738,900   |
| Spelter ..... | 702,000 | 738,400 | 722,100   |
| Tin .....     | 98,800  | 97,700  | 106,500   |

In all cases the output shows steady growth, which is most pronounced in the case of copper, and least so in that of lead, the average yearly increase during the past decade having been as follows: Lead, 2.7 per cent.; copper, 4.5 per cent.; spelter, 4 per cent.; and tin, 3.9 per cent.

A very interesting summary of consumption is included in the statistics, the countries dealt with being Germany, Great Britain, France, and the United States, and from this the following details are abstracted, the figures representing metric tons and applying to the year 1908:—

|                      | Lead.    |
|----------------------|----------|
| United States .....  | 321,000  |
| Germany .....        | 211,300  |
| United Kingdom ..... | 228,800  |
| France .....         | 103,000  |
|                      | Copper.  |
| United States .....  | 210,600  |
| Germany .....        | 180,700  |
| United Kingdom ..... | 128,900  |
| France .....         | 73,900   |
|                      | Spelter. |
| United States .....  | 188,300  |
| Germany .....        | 180,200  |
| United Kingdom ..... | 138,500  |
| France .....         | 78,000   |

|                      | Tin.   |
|----------------------|--------|
| United States .....  | 32,800 |
| Germany .....        | 16,700 |
| United Kingdom ..... | 19,000 |
| France .....         | 7,600  |

The outstanding feature of the returns is the enormous preponderance of the United States as a consuming country and the comparative insignificance of France.

### TORONTO MARKETS.

#### Metals.

Sept. 8.—(Quotations from Canada Metal Co., Toronto.)

Spelter, 5½ to 5¾ cents per lb.

Lead, 3.40 to 3.50 cents per lb.

Antimony, 8 to 9 cents per lb.

Tin, 32 cents per lb.

Copper, casting, 13¾ cents per lb.

Electrolytic, 13.75 cents per lb.

Ingot brass, 9 to 12 cents per lb.

Sept. 8.—Pig Iron.—(Quotations from Drummond, McCa Co.)

Summerlee, No. 1, \$23 (f.o.b. Toronto).

Summerlee, No. 2, \$22.50 (f.o.b. Toronto).

Midland, No. 1, \$21 (f.o.b. Toronto).

Coal—Anthracite, \$5.50 to \$6.75.

Bituminous, \$3.50 to \$4.50 for 1¼-inch lump.

#### Coke.

Sept. 3.—Connellsville coke, f.o.b. ovens:—

Furnace coke, prompt, \$1.90 to \$2.00 per ton.

Foundry coke, prompt, \$2.15 to \$2.40 per ton.

Sept. 3.—Tin (Straits), 30.45 cents.

Copper, prime.Lake, 13.00 to 13.10 cents.

Electrolytic copper, 12.90 to 13.00 cents.

Copper wire, 15.00 cents.

Lead, 4.37½ to 4.40 cents.

Spelter, 5.70 to 5.80 cents.

Sheet zinc, 8.00 cents.

Antimony, Cookson's, 8.50 to 8.62½ cents.

Aluminium, 23.00 to 24.00 cents.

Nickel, 40.00 to 47.00 cents.

Platinum, \$24.50 to \$28.25 per oz.

Bismuth, \$1.75 per lb.

Quicksilver, \$43.00 to \$43.50 per 75-lb. flask.

# Mining Companies

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing, and distributing Annual Statements, Special Reports, Descriptive Pamphlets, Prospectuses, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction. We are making a specialty of engraving and printing bonds, stock certificates, professional and business stationery, business cards and all such work. Orders from mining districts will receive prompt attention.

We shall be glad to furnish estimates to enquirers.

## Canadian Mining Journal

Confederation Life Building - - - Toronto, Ont.

Now Ready

# Richard's Ore Dressing

Volumes III and IV

Per Volume \$5.00 [21s] Net Postpaid

The Set, 4 Volumes, \$20.00 [£4 4s] Net Postpaid

NOTICE—The index for all four volumes will be issued separately and supplied free at an early date to all purchasers of Volumes III and IV.

It required two large volumes to cover the new machinery, processes, discoveries and data in ore dressing. These volumes supplement but do NOT SUPPLANT I and II.

In general arrangement Volumes III and IV are similar to Volumes I and II. The Chapters are each intended to supplement the subject-matter of the corresponding chapters in the earlier volumes, describing new machines, new processes, and giving new data. The greatest care has been exercised in avoiding repetition.

Since the issue of the earlier volumes, many important discoveries have been made and radical departures introduced in established processes. Volume III, for example, has complete discussions of fine grinders, particularly the tube mill and grinding pans, rectilinear tables of the Wilfley type, the questions of magnetic separation, electrostatic separation, the flotation processes, and other subjects of like importance not covered in the earlier volume.

When Volume I was issued, the tube mill, which has almost revolutionized gold and silver milling practice, was

hardly touched upon. The Wilfley table was just finding its place among mills, and a number of other tables of the same type have been developed since.

Volume IV describes in detail some 94 complete mills, showing the most approved modern and successful methods of applying ore-dressing principles in use to-day throughout the mining districts of the world. Comparisons are made with earlier descriptions to show modifications and improvements, and to point out errors in older plants.

Throughout both volumes, much space and great care have been devoted to the general subjects of costs of operation, speed, capacity, water power, life of machines, etc. Power and water plants are described in connection with nearly every mill.

Complete Bibliographies are added. The Index for the entire four volumes has been remade and will be bound separately. It will be furnished without charge to purchasers of Volumes III and IV.

Book Dept. Canadian Mining Journal - Toronto

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## THE ROAD TO GOWGANDA

BY THE

CANADIAN NORTHERN ONTARIO ROUTE

is thirty miles shorter than any other. Beginning February 2nd, through sleepers leave Toronto, 5 p.m. arriving Sellwood (Moose Mountain Iron Mines) next morning. (Breakfast served on train.) From Sellwood to Gowganda is one day's sleigh ride over the company's own road; comfortable road houses are stationed at easy distances and a fast freight and passenger service has been inaugurated with all points in Canada. Inquiries invited:—

Wm. Phillips, General Freight & Passenger Agent,  
C. Price Green, Passenger Agent,

King and Toronto Streets,  
Toronto

**CANADA.—DEPARTMENT OF MINES.**

# Geological Survey

## **PUBLICATIONS**

The Geological Survey has published maps and reports dealing with a large part of Canada and with many local areas and special subjects

### **MARITIME PROVINCES**

The whole of Cape Breton and a large portion of the coal and gold fields of Nova Scotia have been reported upon and mapped on a scale of 1 mile to 1 inch. The remaining portions of the province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter provinces, mapped on a scale of 4 miles to 1 inch.

### **QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the province north of the St. Lawrence are also available.

### **ONTARIO**

A large part of the province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

### **THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the provinces of Manitoba, Saskatchewan and Alberta.

### **BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the province, have been reported upon and mapped.

### **YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

### **THE NORTH-WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

*Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

### **THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:**

#### **NOVA SCOTIA**

- 1019 City of Halifax Sheet.  
1025. Waverley Sheet.

The above two sheets belong to the regular series of Nova Scotia map sheets on a scale of one mile to one inch. The first includes Halifax City and Harbour, the second the Waverley Gold District.

#### **ONTARIO**

1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

#### **BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shews the geology and location of veins.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch, by W. H. Boyd.

NOTE.—Maps recently published may be had on linen cloth for use in the field at the price of 10c. per copy.

### **REPORTS**

1072. Summary Report of the Operations of the Geological Survey for year 1908.

The Geological Survey, under certain limitations, will give information and advice upon subjects relating to general and economic geology. Mineral specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

University of Toronto**FACULTY OF APPLIED SCIENCE  
AND ENGINEERING**

## Courses in

1. Civil Engineering.
2. Mining Engineering.
3. Mechanical and Electrical Engineering.
4. Architecture.
5. Analytical and Applied Chemistry.
6. Chemical Engineering.

Diploma granted at the end of three year  
B. A. Sc. at the end of one additional year.

## Professional Degrees:

Civil Engineer (C. E.)  
Mining Engineer (M. E.)  
Mechanical Engineer (M. E.)  
Electrical Engineer (E. E.)  
Chemical Engineer (C.E.)

For Calendar and other information apply to the  
Secretary

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries  
Quebec.**

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,031 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

**Fernie, British Columbia**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
 Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

CHAS. SIMISTER,  
General Superintendent.

J. D. HURD,  
General Manager.

# WHY IS IT

THAT SALES OF

MORTON'S

# Drill Steel

ARE INCREASING EVERY DAY?

MUST BE IT IS BETTER MATERIAL,

**Gives Best Satisfaction**

AND THE DRILL

**Lasts Longer.**

COULD ANYONE EXPECT MORE?

## Grand Trunk Railway System

# The Longest Continuous Double Track Railway in the World Under One Management.

## The Great Double Track Route Through Canada.

Fast passenger service from the Atlantic Ocean to the head of the Great Lakes. The line taps all the principal commercial centres in Canada and reaches the important points in the States of Maine, New Hampshire and Vermont, the principal towns and cities in the Provinces of Quebec and Ontario, and many important places in the States of Michigan, Indiana and Illinois.

## The "International Limited" (Canada's Railway Greyhound)

### The Finest and Fastest Train in the Dominion

Runs every day in the year leaving Montreal at 9.00 o'clock in the morning for Toronto, Hamilton, Niagara Falls, Buffalo, Detroit, Chicago and intermediate points.

Write for copy of "Trains 3 and 4" descriptive of the route from Chicago to the sea, to J. Quinlan, Bonaventure Station, Montreal, or to J. D. McDonald, Union Station, Toronto.

# MONTREAL STEEL WORKS, LIMITED,

P.O. BOX  
2369 Montreal

Manufacturers of

## Steel Castings

(Acid Open Hearth System)

## Switches and Track Work

for Steam and Electric Roads

## Springs

of all kinds

## Manganese Steel Castings

for wearing Parts, insuring Great Hardness and Durability

INTERLOCKING PLANTS  
TRUCKS FOR ELECTRIC CARS

AGENTS FOR CANADA FOR

**THOS. FIRTH & SONS, LIMITED, SHEFFIELD, ENGLAND**

"Speedicut" High Speed Steel, Tool Steel, Axe Steel, Saw Steel, Files, etc. A large stock carried in our warehouse

**BARROW HAEMATITE STEEL CO., BARROW-IN-FURNESS, ENGLAND**

Quotations for Tee Rails, Fish Plates, etc., promptly furnished. Catalogues sent on application.

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

**General Passenger Department, Intercolonial Railway**  
**MONCTON, N.B.**

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

## Canadian Westinghouse Co., Limited

General Office and Works, HAMILTON, ONTARIO.

Traders Bank Bldg.,  
TORONTO.  
439 Pender Street,  
VANCOUVER.

Address nearest office:  
HAMILTON.  
922-923 Union Bank Bldg.,  
WINNIPEG.

252 St. James Street,  
MONTREAL.  
158 Granville Street,  
HALIFAX.

## HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT      TORONTO      KENORA      WINNIPEG, MAN.  
VICTORIA, B.C. VANCOUVER, B.C. CALGARY. ALTA. NELSON, B.C.

Three Post Magneto Electric Blasting Machine

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

# THE FINEST MINERS' TOOLS

THERE ARE OTHERS, BUT WE KNOW

## "Cleveland" Stoping Drills

Will give you the best results of all. If you are skeptical,  
give us shipping directions, and we will send you one on  
30 days' trial, so you can

## Find Out What They Will Do

in your own mine,—or better still, buy one machine and  
keep a record of amount of Drilling, time laid up for repairs  
and cost of repairs, (if any) and then compare these records  
with similar ones kept of any other stoper. If you will do  
this, we feel sure that when you are ready to order  
more equipments

We Will Get Your Order.

Bulletin 40-A with full information mailed on request.

The Canadian-Cleveland Drill Co., Ltd.  
Cobalt, Ontario.

ROCK DRILLS, PNEUMATIC TOOLS, HOSE, DRILL STEEL, ETC.

## Jeffrey Propeller Fan for Mine Ventilation

This fan is highly recommended wherever the development does not justify the installation of our centrifugal fan.

It has no equal for boosting along feeble currents in large operations.

### A DISTINCT IMPROVEMENT OVER THE ORDINARY DISC FAN

It is self contained, simple in operation and embodies many new features which are described in our Bulletin X23, mailed on request.

We Build

COMPLETE COAL MINE AND TIPPLE EQUIPMENTS

for its excellent equipment. All are pleased with the bright, modern coaches; the exceptionally roomy berths in the sleeping cars; superior dining car service, etc.

The "good cars" bring the C. P.R. hundreds of passengers every week.

All equipment is built in the Angus Shops at Montreal from the most modern designs, embodying every improvement known to practical railroading.

**R. L. THOMPSON, District Passenger Agent, - - Toronto**

# Behrend Concentration System

## Combination WET and DRY

A complete recovery from all slimes and minerals such as Graphite, Galena, Stibnite, Chalcopyrite, Tetrahedrite, Sylvanite, Molybdenite, Stephanite, Argentite, Ruby Silver and and Native Silver.

This system will make low grade deposits pay. Every mine having an eye to business should investigate this system which has the approval of leading mining authorities.

A completely equipped plant, including concentrators, crushers, rolls, etc., for testing purposes is located at address below. Forward a sample of your ore for preliminary test.

## Behrend Concentrators, Limited

## Carbons

(Black Diamonds) for Diamond Drills

[Largest carbon ever found.  $\frac{1}{4}$  actual size.]

NOTE. We personally break (in this country) our carbons, thereby enabling us to determine accurately their quality. We deal only in very best quality and are always ready to ship goods on approval and for selection to responsible parties. Write us.

## Amatite ROOFING

All you need  
is a  
- hammer -  
you'll never  
need a  
paint brush

lay it right over the old roofing. It will cost you less than the continued maintenance of the old roof.

The point to remember is that *you will never need a paint brush* if you buy Amatite roofing. All you need is a hammer, because we supply free nails and liquid cement to finish the job.

Send for free sample of Amatite and you will at once see why it never needs to be painted and why it is more durable and lasting than any other.

Write to-day to nearest office.

When you lay Amatite on the roof you're through with it. You don't have to paint it every year or two to keep it from leaking. It has a *real mineral* surface which does not need painting.

Next time you are due to paint your old roofing, just let it go till the roof is worn out and then get Amatite and

### "THE MINING MAGAZINE."

We have looked with considerable eagerness for the first number of Mr. T. A. Rickard's new monthly. The high standard set by our contemporary, *Mining and Scientific Press*, led us to expect even better things from *The Mining Magazine*. And we have not been disappointed.

For the benefit of those of our readers who have not yet seen a copy of *The Mining Magazine*, we may explain that it is a new monthly mining periodical, published in London, England. Its object is to supply mining men, all over the English-speaking world, with a just monthly summary of mining news and technical progress, and a careful digest of current professional literature. Its publishers believe that a monthly publication will be best suited to this end. Specifically its aim is well summed up in the first editorial paragraph of the first number: "The purpose of this periodical is to be useful to those engaged in mining."

It is superfluous to say that *The Mining Magazine* will be honestly and capably conducted. Mr. Rickard's name is ample guarantee of this. But we shall expect more. If the initial number may be taken as a representative sample, and not a specimen, *The Mining Magazine* is assured of success. Its editorials are clear, outspoken and interesting—and of these three virtues the last is the rarest. The arrangement is effective. A general review of mining precedes the editorials. These are followed by special correspondence from the larger mining centres. Then come the markets, discussion, contributed articles, and the regular departments, of which that entitled "Précis of Technology" seems eminently instructive.

With the exception of one anonymous article on "Investments and Speculations," the entire 82 pages of reading matter in the first number of our youngest contemporary are alike readable and useful. This anonymous article includes a tabular classification of mining shares according to their present value as investments. *The Mining Magazine* treads on dangerous ground in giving this class of article. Although published in all good faith, material such as this is extremely open to misuse. We agree heartily with the editorial dictum of *The Mining Magazine* itself, that it is best to leave stock market tipping to the financial periodicals. But in justice to *The Mining Magazine* we must assure our readers that our contemporary's avowed policy emphasizes this point as strongly as does our own.

In welcoming *The Mining Magazine* we are not fulsome when we say that it is bright, clean, thoroughly reliable, and, from a technical point of view, more than

excellent. We commend it strongly to Canadian mining men.

### A CUSTOM SAMPLER FOR COBALT.

Some time ago a mild request was put before the Ontario Government. Facts, figures, and opinions were presented shewing, or tending to shew, that beneficent results would accrue to the Cobalt region if a public sampling plant were erected in Cobalt. We believe that the proposal was given not unfavourable consideration. However, although an appropriation was actually made, the scheme withered and died.

Possibly this was well. Nothing beyond a rather indecorous auction sale has come of the Ontario Government's attempt to operate the Provincial mine on the Gillies Limit. The Department of Mines has been, and is, undermanned. One devoted official inspects all the mines of the Province, and, during the life of the late lamented Provincial mine, the same official acted also as mine manager. Hence we have misgivings as to the manner in which a public sampler might have been operated.

It has always appeared to us that a modern sampling plant is a *sine qua non* in any large metal-mining camp. Cobalt needs one, not only because of the variable and complex character of its ores, but also because of the camp's relation to the smelters and to the market generally. Study of the situation compels us to conclude that an independent sampling plant, well-situated to receive and discharge shipments of ore, will surely promote peace between the ore-producer and the ore-buyer, and will, in the long run, influence favourably the prices paid.

It has remained for two enterprising young Canadians to carry out the project of designing and erecting a custom sampler in Cobalt. Messrs. Campbell and Deyell, who have practised for some years in Cobalt as surveyors, assayers, and mining engineers, have elaborated plans and specifications for a suitable sampler, and have also, we understand, succeeded in interesting sufficient Canadian capital to warrant the immediate construction of the plant.

On another page we publish full particulars of the projected sampler. It suffices here to signify our warm approval of the new enterprise.

### THE PETERSON LAKE SQUABBLE.

From the Cobalt Peterson Lake—Nova Scotia controversy there is at least one lesson to be learned. An acrimonious dispute arose over the alleged carelessness of the Nova Scotia Silver Cobalt Mining Company in working ground leased from the Peterson Lake Silver Cobalt Mining Company. Into the particulars of the case it is hardly profitable to go. But it is evident that through lack of skilled supervision the Peterson Lake

Company has been placed in an awkward position. So also has the offending Nova Scotia Company. If the mining operations of both companies had been under the absolute control, not of absentee directors, but of competent mining engineers, the dispute never would have arisen.

Engineers were engaged by the Peterson Lake Company at the eleventh hour. Mr. Segsworth's report, which we have had the pleasure of reading, is definitive, careful, and businesslike. It stands out in strong relief when compared with many of the slim documents, labelled reports, that have emanated from Cobalt. Associated with Mr. Segsworth was Mr. J. W. Astley, formerly of Le Roi mine. The report reflects credit upon both gentlemen, and, as is always the case when competent engineers are concerned, it deals logically with hard facts, presenting them in such a way as to be thoroughly intelligible to the layman.

There are several mines and many prospects in and about Cobalt that require diagnosis and treatment by a real mining engineer. The *bona fide* mining engineer is always called upon in time of trouble. But it is better business to get him as a preventive rather than as a cure.

### THE DUNCAN RIVER COUNTRY, B.C.

A mining region of great progress is the Duncan River country, north of Kaslo, B.C. The lead-silver ores of this district are well worth exploiting. Authentic analyses show that some of the ore bodies carry high percentages of lead and respectable quantities of silver. Assays carrying from 50 to 100 ounces of silver, along with from 50 to 65 per cent. of lead are not uncommon.

The absence of roads has deterred the development of the Duncan River district. It is expected now that the Provincial Government will commence the construction of wagon roads at an early date. Indeed a good road is even now under construction. This leads up Hall Creek and will form one link in the necessary chain.

The Government of British Columbia will be amply repaid in the future for any expenditure of this kind undertaken now.

### POLAR POLEMICS.

When the jaded citizen turns to his evening news paper for refreshment, ten to one his eye falls upon columns of Cook and pages of Peary. Already we are sufficiently familiar with the domestic virtues of both gentlemen. We know how each of them looks in deer skins, and in conventional garb. We know Peary's opinion of Cook, and Cook's opinion of Peary, and we have formed our own opinion of both. And our own opinion will require censoring if this kind of thing is continued.

In Montreal are several clever gentlemen who make a specialty of merging and combining industries that are

in a delicate condition. Would it not be practicable for these same gentlemen to amalgamate Peary, Cook, and our own brawny Bernier? "Amalgamated Polar Publicists" has a goodly sound.

With Mr. Roosevelt making strange noises from out Central Africa, Lieutenant Shackleton orating about the Antarctic, and Cook and Peary at garrulous war, our intellect is in danger of total eclipse.

### THE STAMP-MILL.

The development of the heavy stamp is one of the outstanding features of ore-dressing practice during the last twenty years. Two decades ago, the 900-lb. stamp was the heaviest in use in America. It is true that, even at that date, heavier stamps (1250-lb.) were in use at a few mines on the Rand. But these did not set the fashion, and little was known then of their performance.

Exhaustive experimental work on the Rand, work in which Mr. W. A. Caldecott was a leading spirit, demonstrated clearly the higher commercial efficiency of heavy stamps. Roughly, a weight of at least 1750 lbs was indicated as desirable, and, of late, stamps heavier even than this have been installed. Incidentally, experience has shown that the cumbrous cast-iron anvil block is a superfluity. Heavy concrete foundations, with merely a thin layer of insertion between the concrete and the mortar-box have given entire satisfaction, notwithstanding the increased weight of the stamps.

In Mr. Caldecott's paper, "The Development of Heavy Gravitation Stamps," reproduced in this issue, these and other points are elucidated. Mr. Caldecott's papers are the ripe fruit of experience. We commend this paper to our readers.

### THE COPPER RESOURCES OF VANCOUVER ISLAND.

What the future has in store for Vancouver Island as a copper producer is foreshadowed in a letter written by Mr. W. H. Trewartha-James, general manager of the Tyee Copper Company, and published in the *Victoria Daily Colonist*.

Mr. Trewartha-James estimates that Vancouver Island has produced, during the past five years, about one-half the copper that has come from the entire Pacific Coast district.

During the twelve months ending August 31st, 1909, the Tyee Copper Company's smelter at Ladysmith turned out 3,500,000 pounds of copper, 52,000 ounces of silver, and 7,000 ounces of gold. This includes about 208,000 pounds of copper produced during six months from a group of mines on Vancouver Island.

But it is evident that Vancouver Island has hardly begun to get its stride. The Island is, to a large extent,

*terra incognita*. We believe that the opening up of its mineral deposits will be a vital factor in the industrial progress of British Columbia. Interest can best be aroused by public pronouncements of responsible men like Mr. Trewartha-James.

### EXPLANATORY.

Commenting upon an editorial that appeared in our issue of September 15th, the *Evening Citizen*, of Ottawa, while admitting that the *Canadian Mining Journal's* strictures upon certain daily papers are to a considerable extent justified, claims that there is great difficulty in securing reliable mining news, and that daily papers cannot afford to maintain correspondents in mining camps.

The contention of our respected contemporary is, no doubt, quite true. But it hardly covers the point under discussion. We contend that our daily journals should least of all afford to accept and publish the extravagant misstatements of promoters and brokers. How far each paper can go in the direction of getting authentic news is a function of each paper's enterprise.

The *Evening Citizen*, to give further force to its argument, takes exception to our Special Correspondence columns. It charges us with carelessness and inaccuracy. Notices regarding mining properties, states the *Citizen*, in the Elk Lake district or Gow Ganda, or Miller Lake, are published in the *Canadian Mining Journal* under the head of "Cobalt news." This the *Citizen* takes as evidence that we are "getting the four camps mixed up."

As the charge is apparently made without levity, we must hasten to assure our contemporary that we are not ignorant of the geography of Northern Ontario. In fact much of that same geography has been learned to the pestiferous accompaniment of black flies and mosquitoes.

The explanation, if explanation be needed, is simply that most of our correspondence, gathered from many sources, is actually written in Cobalt. Cobalt is still the hub of the northern silver district and the gathering and distributing centre for mining news. Quite seriously, it had never occurred to us that the arrangement of our Cobalt news letters could lead to confusion. We had taken it for granted that the great bulk of our readers had some idea of the relative positions of the old and new mining camps of the north. We hope that the *Citizen* will clear its editorial mind of the horrible suspicion that we don't know Cobalt from Gow Ganda.

### AN OMISSION.

In our issue of September 15th, there appeared a reproduction of the flow-sheet of the Goldfield Consolidated mill. Mention was made of the fact that the Allis-Chalmers Company furnished the machinery for this plant. To this should have been added the statement that the Deister Concentrator Company installed 70 of their No. 3 tables.

# THE PROJECTED CUSTOM SAMPLING PLANT—TO BE ERECTED THIS YEAR IN COBALT, ONT.

Written for the Canadian Mining Journal.

The question of a sampling plant in the Cobalt camp has long been mooted, and it is only within the last few days that final arrangements were concluded enabling Messrs. Campbell and Deyell to proceed with their plans and erect the works, the general scheme of which was laid before the mines, smelters, and government some months ago. Negotiations are in progress with the La Rose Company whereby the Sampling Company proposes to lease a site from the former. Should this arrange-

SITE SELECTED FOR C. & D. SAMPLER—LOOKING SOUTH.

ment be carried through satisfactorily, the first sod will be turned in the next week. The site as shown in the accompanying plate is the strategic position for such a works.

The province of the Sampling Company will be to sample and assay all the products from the mines, thereby establishing the percentages of the constituent values, such certified estimation to be the basis of settlement between mines and smelters. The company proposes to take ore from the mines in large or small quantities, weigh, sample, assay, giving their certificate to both mine and buyer. Storage capacity will be provided for ore that is not immediately sold and for purposes of holding ore until the proper material has been added to bring it up to smelter requirements. When shipped, the ore will be placed in non-leakable bags and consigned under seal. The bullion resulting from the melted metallics in the ore will be shipped to smelter or refinery according to understanding between buyer and seller of ore. Certificates will be given in respect to silver, stating weights and amount of silver in friable ore; also weight and number of ounces in bullion, with allowances for slag, dust, loss, moisture, etc. The analyses for cobalt, nickel, arsenic, silica, lime, iron, etc., will be given in percentages.

A few of the functions of such a concern are:—

1. To have a neutral party value the product between buyer and seller.
2. To permit the producer to realize quickly on his raw product, and thus place him in a stronger financial position even should he not find an immediate market.
3. The grading of the various ores to enable the producer to meet the variations of the different markets.

4. To enable the buyer to procure a product most suited to his metallurgical requirements, thus eliminating the chance of getting undesirable products on his hands. The great complexity of the Cobalt ores renders it difficult to more than guess at the percentage of constituents before sampling. The works will thus place the mine and smelter on a sane business footing.

5. Being the only plant in Eastern Canada of its kind, its sphere of influence will be large, and it will tend to centralize the mining industry, which at present has no recognized centre.

6. The direct benefit to the town of Cobalt and to the T. & N. O. Railway derived from the establishing of a valuing point at Cobalt need only be suggested to be appreciated.

In answer to the objection that such a works should have been erected at the inception of the mining in Cobalt, and that the camp is now at its zenith and in consequence is too late to erect a plant, it may be said that such objection is not valid. The camp is not yet at its zenith, as later we will prove, and also, conditions of market and knowledge of the ore would not have permitted the successful operation of a sampling works, if erected previous to the present year.

In the early history of the camp the heads of the most prominent sampling concerns across the line came and pronounced a sampling works not feasible. Since then the smelters have evolved mechanical methods, and the ore sampling concerns across the border have instituted a system of quadruple checking by hand sampling. The great difficulty met with is in the presence of the metallics and the non-uniformity in composition of the ore. The method evolved by Messrs. Campbell and Deyell and to be used by the company is that of fine

SITE SELECTED FOR C. & D. SAMPLER—LOOKING EAST.  
La Rose and O'Brien Mines in background.

grinding in a Ball mill of all the ore, the pulverized portions being screened off and thoroughly mixed, split into four equal parts by automatic riffle samplers, each of the resultant quarters being separately sampled down to the requisite laboratory sample. All this process is automatic, and permits of four separate samples of each shipment of ore. The metallics are extracted from the

SECTION  
THROUGH  
LOW GRADE PLANT

SECTION  
THROUGH  
HIGH GRADE PLANT

screens of the mill and melted into bar bullion and sampled by a special method. The low-grade ore is treated by a modification of the above-mentioned principle. The personal equation has been eliminated from the processes to the greatest possible extent, all important operations being entirely automatic.

The question now arises as to the permanency of the camp, and is largely answered by its past and present performance, by its present ore reserves, by the general confidence of those in close association with the mining there and by the industrial enterprise based on a prolonged life of the camp. In the latter respect the following may be mentioned:—

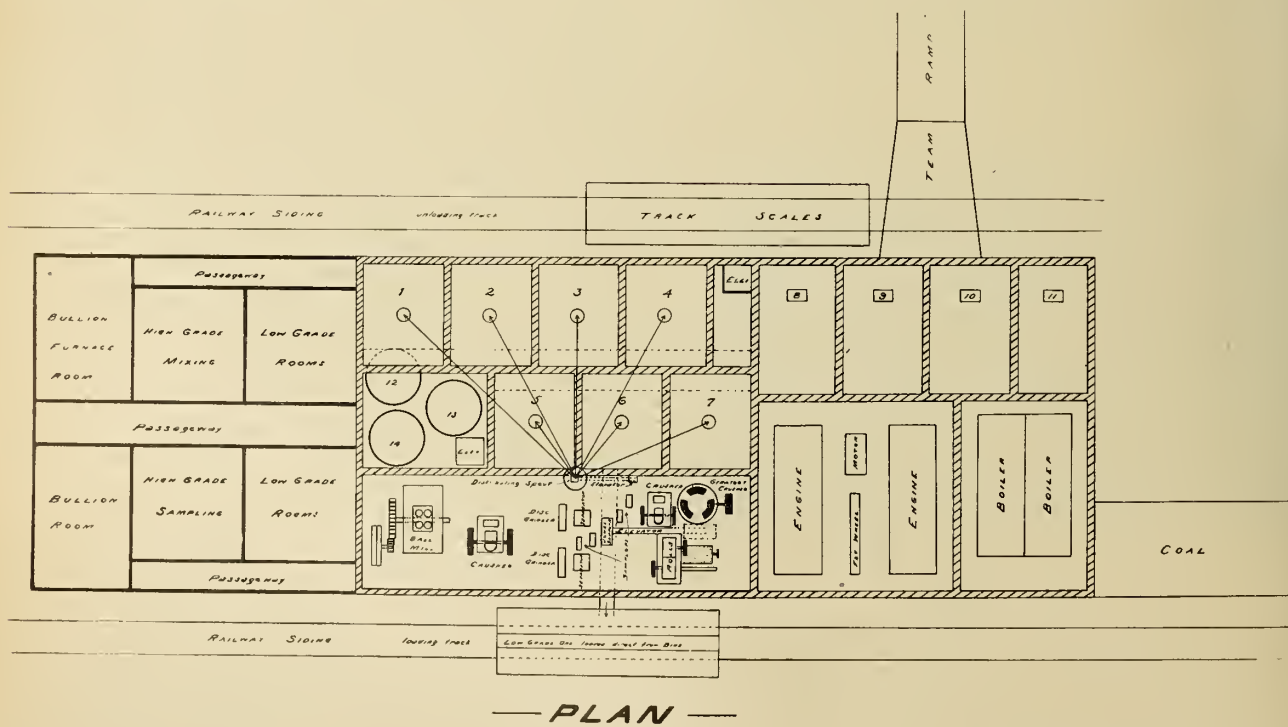

1. Power companies. There are three of these concerns, who estimate their initial expenditure at about \$3,000,000.00.

2. The proposed double tracking and installation of electric traction on the T. & N. O. between Cobalt and Haileybury, also the erection of the new station at Cobalt.

3. Municipal improvements; sewage and waterworks, and erection of more substantial buildings in Cobalt.

4. Electric railway between Cobalt and Haileybury.

5. Concentrators. There are now eight concentrators in operation in the camp—five under construction and one projected. The present capacity is 635 tons per day.

NOTE—Bins N° 1 to 7 are for Low Grade Ore (Reject) Directly under these are Stock Rooms for High Grade Ore in bags. Hoppers N° 12, 13, 14 are for High Grade Rejects which are to be bagged. Bins 8, 9, 10, 11 are for Low Grade Ore from the mill.

This will be increased to 1,000 tons when the other mills are completed. It is estimated that the aggregate cost will total \$1,000,000.

The production of the camp has been as follows:—

|                        | Tons.            | Value.             |
|------------------------|------------------|--------------------|
| 1904.....              | 191.55           | \$136,277          |
| 1905.....              | 2,336.01         | 1,485,530          |
| 1906.....              | 5,836.59         | 3,573,908          |
| 1907.....              | 14,851.34        | 6,476,555          |
| 1908.....              | 25,510.91        | 9,000,000          |
| 1909, to June 30, '09. | 15,000.00 (est.) | 5,290,000          |
|                        |                  | <hr/> \$25,962,270 |

The shipments to August, 1908, were 14,564 tons; to August, 1909, 20,300 tons; which shows an increase of 40 per cent. in tonnage for this year, which, if it holds, will make about 35,700 tons for 1909. The tendency, owing to the operations of the numerous concentrators, is towards a one-value product. This will decrease the tonnage proportionately and concentrate the values, while the more comprehensive mining policy now in vogue will tend towards a uniform lower grade product of greater tonnage, instead of robbing the reserves for false dividends and having to balance up later on on dump material. It is estimated the average value of the product shipped this year is the same as that of last. The above factors will tend to maintain and even

increase the tonnage, according to development, while shipping the same grade product.

A contradiction to the statement that Cobalt has not been a good investment and has only enriched those who have traded on its spectacular showings, is found as follows:—

Approximately, the O'Brien and Drummond, the privately owned mines, have netted their owners \$2,100,000.

Including the non-dividend payers, Nancy Helen, Chambers-Ferland, King Edward, Nova Scotia, Peterson Lake, Foster and Green-Meehan, and also the fourteen dividend payers, we see that these 21 companies have a total issued capital of \$49,895,568; total dividends to June 26, 1909, \$11,916,510; dividends paid in 1909 to June 26, 1909, \$4,016,970. Figuring from the summer of 1905, when most of the companies were incorporated, these mines as a whole have paid 6 per cent. on the money invested. The rate of interest for this year, taken from the above figures is about 16 1-10 per cent.

The figures given do not include royalties.

The total value of ore to June 30, 1909 (est.), \$26,000,000.

|                          |              |
|--------------------------|--------------|
| Total dividends .....    | \$14,062,510 |
| Total royalties .....    | 934,122      |
| Cost of production ..... | 11,000,368   |

on a basis of 50c an ounce for silver (waiving the copper, nickel and arsenic values), the cost of production including marketing would be 21c per oz.

It should be remembered that silver was produced very cheaply in the first two years of the camp during the gathering stage.

For the year 1908 some costs were as follows:—

| Mines.                | Gross Value. | Charges.  | Cost of Production (include marketing). |
|-----------------------|--------------|-----------|-----------------------------------------|
| La Rose Consol. . . . | \$819,823    | \$281,420 | 17c oz.                                 |
| Kerr Lake . . . . .   | 789,312      | 247,359   | 15 6-10c oz.                            |
| Nipissing . . . . .   | 933,544      | 339,078   | 18 1-2c oz.                             |
| Crown Reserve . . .   | 910,350      | 159,984   | 9 3-10c oz.                             |

These show that notwithstanding the increased difficulty in extracting the ore, these companies are still able to mine within the average.

With regard to the surrounding camps, little can be said other than that legitimate mining has just commenced, and there is some good positive evidence in favour of some of the ore bodies. They can but enhance the silver output.

The accompanying prints show diagrammatically the layout and process of the proposed works. They do not purport to be complete, except in principle.

As a corollary, it may be said that the capitalists interested in this Sampling Company are all residents of Toronto, and are not in any way connected with mines or smelters. Messrs. Campbell and Devell hold control of the stock in order to ensure the present and future neutrality of the company.

### DISCOVERY.

There has been a lot of discussion in Northern Ontario concerning the advisability of requiring an affidavit of discovery of "valuable mineral in place" at the time of recording a claim. The wording is explicit and requires of the prospector a condition that in other provinces is only required or is expected after an opportunity to thoroughly explore the claim.

For instance, in Quebec, under the new Mining Act, any holder of a prospecting certificate may stake out a claim on finding "mineral" or an "interesting indication." Then he has four months to prospect his claim before recording or making any payment whatever. Then the discovery of mineral and a rental per acre is required. If nothing is found the claim may be abandoned.

Again, in British Columbia a "valuable deposit of mineral" is required. This is defined as "mineral in place, in appreciable quantity, having a present or prospective value sufficient to justify exploration." The last phrase allows the prospector an opportunity to open up a favourable indication without leaving himself open to a charge of perjury, which is the only result of the hard and fast Ontario law.

Having in mind the area being prospected for silver in New Ontario, the most conscientious prospector would not hesitate to stake on a showing of cobalt bloom, yet it could hardly be called a "valuable mineral in place;" it is only a favourable indication. The only possible thing is to find native silver or its ores, which is absurd to expect in every case. So the prospector, knowing the impossibility of living up to the exact letter of the law, allows himself a loose interpretation of it that practically nullifies the discovery requirement. For instance, having found a flake of iron pyrites in diabase, he will stake a claim. He argues that iron pyrites is a valuable min-

eral and is assuredly "in place," so for the chance to prospect he will commit perjury, morally and perhaps legally, depending on the interpretation of the law.

All the prospector wants is a chance to prospect. Due to staking booms, this is almost impossible in New Ontario. The man who conscientiously tries to prospect finds it staked from under him and tied up for an indefinite period. His only recourse is to stake first and prospect after, which introduces the harsh word perjury. A big factor in these rushes is the fact that a staker may stake three claims each on behalf of as many of his acquaintances as take out licenses. This has introduced many evils, including "blanketing." In one case a gang of men staked out ninety claims "en bloc," in the depth of winter, with four feet of snow on the ground. Many other groups of from twenty to fifty claims were staked out at the same time. Operations like this force the prospector out in winter, when it is ridiculous to think that a bona-fide discovery could be made on even one per cent. of the claims recorded.

The discussion aroused by these conditions would indicate that some change will have to be made soon, to give the prospector a chance. The remedy can only be arrived at by discussion and consideration of amendments in the law as it stands at present.

Some have proposed that the locator only be allowed to stake for himself. This would greatly lessen the evils of the "rushes" and would force the locator to be more careful in his prospecting. Company interests may object, but the hardship to them would not be very serious.

A relaxation of the stringent requirements as regards discovery would create a greater regard for the law, but under the present act would not be of much benefit. If coupled with a provision, such as is in the Quebec law, allowing some time to prospect after staking, but before recording it would undoubtedly relieve the situation.

But while one man may stake out any number of claims, rushes, winter staking and perjury in regard to the discovery of "valuable mineral in place" will flourish.

It is to be hoped that mining men who are interested in the opening up of the undeveloped mineral areas of Ontario will take part in a discussion; that can do no harm, and will, no doubt, be of much benefit in bringing before the authorities suggestions for the improvement of the admittedly imperfect Ontario Mines Act.

J. D. CUMMING.

113 Bedford Road, Toronto.

A suggestion was made some time ago in South Africa that coloured wrappers be used for explosives, so that detection of unused fragments in sumps and working faces would be easier. This has been improved upon now by the proposal that the explosives themselves be coloured. If each kind of explosive used were given a different colour, accidents might be traced more readily. This might entail a small sacrifice of strength, but the compensation in added safety would no doubt be ample. Of course, both wrapper and explosive should be coloured. Unsulphonated red azo-dye, being soluble in nitro-glycerine, would be suitable for colouring the explosive.

# SOME NOTES ON THE HISTORY AND RECENT DEVELOPMENT OF THE CANADIAN MINING INSTITUTE.

Paper read before the Cobalt Branch of the C.M.I. by Secretary H. Mortimer-Lamb.

Although the Canadian Mining Institute is still relatively a young organization, it may be safely assumed that a very considerable proportion of its present membership is uninformed concerning the early history of the society or the causes that led to and resulted in its organization, nor have a number knowledge of its traditions, and the useful services it has rendered the mining industry since its inception. This ignorance, if it may be so termed, is readily understood when it is considered that mining engineering, unlike most other professions, is a sort of will-o'-the-wisp to those who follow it. It is rare for a man belonging to this profession to remain for any length of time in any one place or country. If he succeeds in establishing a reputation in a particular locality, there immediately arises a demand for his services, with the proffer of greater inducements elsewhere. If, on the other hand, his management of a mine in one camp is inefficient, he necessarily drifts on with the stream. Thus, of the original membership of the Institute few now remain on the list, the ranks having been recruited year by year, and especially during the past two years, by new men—men either of a younger generation, fresh from the mining schools, or by engineers or mine managers or superintendents representing outside capital, recently attracted to Canada. Nothing, in fact, indicates more forcibly the cosmopolitanism of mining than the character of the membership of the Canadian Mining Institute, which is in itself an essentially Canadian institution, yet includes amongst its members a very large number of men owning other nationality—the United States, Germany, France, Sweden and Italy.

To begin at the beginning, the Canadian Mining Institute as constituted to-day was not of spontaneous generation. Its inception and development followed along evolutionary lines. In the year 1890 a very pernicious and unjust measure was passed by the Quebec Legislature, imposing a royalty of 3 per cent. of the gross value of the product upon mines already alienated from the Crown by actual sale, without any reservation of the right to levy such royalty. The Act also contained other provisions similarly retroactive in effect and unfair in character. It was realized that if this Act were allowed to become operative, it would not only be a heavy blow to established industries, but would also seriously check new enterprises. At this time the only periodical devoted exclusively to Canadian mining interests was the "Review," published at Ottawa, and edited by Mr. B. T. A. Bell, a young Scotsman possessed of extraordinary energy and a forceful personality. At his initiative a meeting of the mine operators of the Province of Quebec was convened and held in the Windsor Hotel, Montreal, on January 23rd, 1891, primarily to combine to oppose this measure, but during the evening a resolution was formally adopted whereby the Quebec General Mining Association came into existence.

Following this example, a year later, March, 1892, the organization of the Mining Society of Nova Scotia was effected as the result of a circular issued by Messrs. J. E. Hardman, R. G. Leckie, Chas. Fergie and others

to the mining men of the province, in which their co-operation and interest were invited in the formation of a United Miners' Association, the object of which was to promote generally the welfare of the mining industries. The society immediately justified its existence by its success in inducing the Provincial Government to modify, and in some instances to amend entirely, certain ill-advised clauses in the province's enactments relating to mines and mining leases, which were shown to be inimicable to industrial interests.

Ontario was the last of the three Eastern Canadian mining provinces to organize; but here again, thanks to Mr. Bell's exertions, this was accomplished in April, 1894, when a meeting was held for the purpose at the Rossin House, Toronto. Of those among the first to sign the roll of membership it is interesting to note the names of Prof. W. G. Miller, who for the past two years has so worthily filled the office of president of this Institute; Mr. R. W. Leonard, Mr. T. W. Gibson, Dr. Goodwin, Dr. Nichol, Dr. Coleman, Mr. J. M. Clark, Mr. J. T. Laidlaw, and others well known to us here. The existence of the Ontario organization as an independent body was, however, brief. The society, in fact, was never incorporated, since when this was proposed the question of the federation of the three associations had already been mooted, and the men of Ontario fell readily in with the project. But while the desirability of the step was generally agreed upon at a united meeting of the three societies at Cape Breton in July, 1894, federation was not finally consummated until January 10, 1896.

The birthplace of the federated Canadian Mining Institute was Montreal. Its first president was Major R. G. Leckie. The scheme, which had as its main objects economy in publication, consideration of matters affecting or relating to the mining industries of the Dominion within the jurisdiction of the organization, and the holding of a united meeting annually, aiming in no way to interfere with the autonomy of the respective societies, proved only moderately effective; and when in 1898 some accessions in membership were obtained from British Columbia, it was decided to reorganize on somewhat broader lines by the creation of a society under one central administration, which should be essentially national in its aims, character and scope. Thus, at the close of the annual session of 1898, the Federated Canadian Mining Institute was dissolved, and the Canadian Mining Institute incorporated by Act of Parliament, founded in its stead. The Institute's first president was Mr. John E. Hardman, while Mr. Bell continued to act as secretary until the time of his death in 1904. When originally organized, the membership of the Institute was but sixty-three; but its success was assured from the start, and before the close of the year this number had increased to one hundred and ninety. To-day it is between eight and nine hundred.

The popularity of the Institute and its growth during the past eleven years may, perhaps, be attributed to two principal causes: the fortunate selection of public-spirited and able men to direct its affairs as members

of the governing body or Council; the tangible results achieved by the society in the interests of the mining industry. The first of these causes is naturally paramount in importance, for the Institute could not have influenced public opinion, secured recognition from governments, or otherwise played as it has a momentous part in the amelioration of conditions, had the men who administered its affairs and policies been anything else but zealous, able and disinterested. It is, meanwhile, a matter of record that one of the Institute's presidents, at the time resident in a distant part of the country, never once failed in his attendance at a Council meeting during his two years' term of office, although to perform this duty he was obliged on each occasion to undertake a special journey of over a thousand miles. To attend an annual meeting the president elected in 1907 travelled over six thousand miles, while last year the president of the Institute devoted no less than seven weeks of his time to duties, at times prodigiously strenuous, which fell to his lot as the Institute's chief executive officer and leader of the ocean-to-ocean excursion, representing over ten thousand miles of continuous travelling. These are merely instances. It may be added that there are very few men who have served on the Council to whom almost equally high tribute might not be justly paid; and to their devotedness, interest, loyalty and singleness of purpose the society is very deeply indebted.

As to the actual accomplishments of the Institute during the period under review, there have been, of course, advantages common to all successful societies of a like nature; such advantages, for example—social and educational—as are expected to be derived from professional intercourse, the interchange of views and ideas between men following the same calling, and by the publication and dissemination of valuable information and records. But probably no mining society in the world has exerted its ascendancy to an equal degree or to better purpose in safeguarding the interests of its members, or rather of the industries they represent, against the passage of oppressive or ill-advised legislation, or has done more to influence the introduction of remedial measures where these were necessitous. Merely to indicate the scope of the Institute's activities in these directions, allusion need but be made to one or two instances of its successful opposition to the passage or operation of ill-considered legislation, such, for example, as the Order-in-Council of the Ontario Government in 1899, recommending the imposition of an export duty on copper-nickel ores and mattes—the effect of which, had it been put in practice, would undoubtedly have been to paralyze the nickel industry in Canada; and the proposed "Act to amend the Mines Act" of Ontario, 1900, which, as originally framed, passing a first reading, imposed absolutely ruinous and prohibitive taxes on the mining industry of the province. Again, in more recent times the advice of the Institute has been repeatedly sought by both the Federal and Provincial Governments in respect of proposed mining legislation, while if the society had done nothing else, its claims to consideration would have been more than upheld by the successful result of its endeavours whereby a Federal Department of Mines has been established under the direct administration of a responsible Minister. The recent repeal of the Quebec Mining Law, and the enactment of a new set of regulations decidedly more conducive to the encouragement of legitimate prospecting and industry, is also directly traceable to the Institute's representations.

Other testimony might readily be adduced in evidence of the Institute's activity and services in the past,

but doubtless sufficient has now been mentioned to fully serve the present purpose.

It may now, meanwhile, be permissible to refer more specifically to the objects of the Institute, to the ideas of the promoters who formulated them, and to compare conditions existing when these ideas were adopted with conditions to-day, in the hope thereby of provoking discussion on some of the questions involved. Briefly, then, these objects as set out in the Institute's charter, comprise the promotion of the arts and sciences connected with the economical production of valuable minerals and metals; the distribution of information; the establishment of a central reference library and headquarters; concerted action upon matters affecting the mining and metallurgical industries of Canada, and lastly, the encouragement and promotion of these industries by all lawful and honourable means. These objects, it will be noted, cover a very wide field, and are very much more comprehensive, than the sole object, for example, of the Institution of Mining and Metallurgy, which, as a strictly technical society, confines its aims to the general advancement of mining and metallurgical science. The charter of the Canadian Mining Institute, moreover, differs from the constitution of the Institution of Mining and Metallurgy in that the former contains no clause relative to the qualifications required of persons seeking enrollment as members, the matter being regulated merely by by-law, which is subject to amendment at any annual meeting; whereas in the case of the latter these requirements are very explicitly defined, and are not amenable to change. The records of the Institute, however, show that its founders very carefully considered the issue of the desirability, or otherwise, of organization on strict lines of technical or professional qualifications; and the conclusions then arrived at that the time was not opportune to attempt to found a society composed exclusively of professional men, and that, furthermore, if all conditions were favourable to the promotion of such a project, greater ends might be served by organizing on broader lines, and thus launching an organization which would embrace within its scope of activities not only the promotion of the arts and sciences of mining, but that of the industry of mining also. Hence, this was the idea that found expression in the charter, and the by-law regulating the matter of the eligibility of candidates for enrolment gave the Council practically without limitation or restriction discretionary powers as to whom they might admit to membership. Every system, however, is liable to abuse, and there can be no doubt that during the first few years of the Institute's existence, in the natural desire to increase its membership, less care than might have been was exercised in scrutinizing the status of certain candidates, with the result that several were admitted whose admission reflected no credit on the organization. No change in this general policy was made until some three years ago, when, at the annual meeting in Toronto, a new by-law was adopted establishing a second class of membership, those elected to which being termed "associates." This new by-law, while not limiting the Council's discretionary powers, was at least a suggestion to that body to thereafter discriminate between technically and non-technically qualified persons applying for enrollment, by classifying the latter as associate members. As to the advantage of this change opinion is still somewhat divided, although generally it is believed favourable. At the same time, it is fair to add that at least one member of the Council has registered a protest against the present practice, on the grounds that in his opinion it is not in the interests of the Canadian

Mining Institute, nor of the mining industry, nor of the profession of mining engineering, to attempt to establish a class distinction in the Canadian Mining Institute under existing conditions. In other words, the opinion of this gentleman appears to be that since the Institute represents an industry and not a profession, membership classification or discrimination, such as may be practised by essentially technical societies, is not one of its legitimate or logical functions. On the other hand, it may be well argued that while this may not be in accord with established precedents, these in a new country may be ignored without fear of dangerous consequences; and that, therefore, the Institute need not be deterred from adopting a policy of its own that would differentiate it from any other society of similar aims, for the reason merely that it would appear to be a departure. Admitting this, it but remains to discuss the question of the policy of classification on its merits. The most important point of all is how it has affected and how it is likely to affect the general development and usefulness of the society. So far as the by-law's recent operation is concerned, it is difficult to prove that it has exerted any injurious effect. This by-law has now been in force for nearly three years. In that time the membership has very nearly doubled. In 1907 there were elected 161 members and 34 associate members; in 1908, 87 members and 62 associate members, and in 1909 to date, 49 members and 52 associate members. During these three years only three candidates for membership have objected to their classification as associates, and in but one case has a candidate withdrawn his application in consequence of a ruling. This gentleman was a director of mining companies, his actual knowledge of mining was merely perfunctory, and in no sense professional or even practical. The Council, acting in accordance with the implication of the by-law, could not, therefore, have well come to any other decision than they did in adjudicating on this application.

It will be noted that the distinction between a member and an associate member is little more than nominal, the associate having all the privileges of membership, with the exception only that he is debarred from holding office. The attempt to classify the membership may be said, then, to have a sentimental basis rather than anything else, although its ultimate aim may be eminently practical. Thus, even full membership in the Canadian Mining Institute does not at the present time imply professional proficiency or even professional experience. A graduate fresh from college is as eligible for full membership as is a mining engineer old of international repute. The Institute merely draws a line, and a not particularly distinctive line, between those professionally engaged and those commercially engaged in the mining industry. Nevertheless, even this somewhat meaningless discrimination has, in the writer's belief, served to popularize the Institute with the class of men whose interest and support is of most value to the society. Although, as has been stated, the Institute represents an industry and not a profession, it can scarcely be disputed that the esteem in which the organization is held and the influence it exerts, is mainly attributable to the fact that its membership is preponderantly professional in character. Again, the technically trained engineer or practical mining man is necessarily in a position to render greater service to a society, one of whose chief objects is the publication of technical information, than another whose qualifications to express himself authoritatively on this subject are entirely limited. To complete the argument in favour of membership classifications, it may be further

urged that no person desiring to join the Institute for legitimate reasons, such as to secure its publications, attend its meetings, or participate in its work, could or would offer reasonable objection to being classified as a non-technical man if he had no claim to the title of mining engineer. On the other hand, it is conceivable that one proposing to make improper use of his membership by, as has been done in the past, advertising it as proof of expert qualification, would strongly disapprove of a discrimination which might easily interfere with his schemes in this regard.

Against the system of discrimination the strongest argument, perhaps, is that it is not sufficiently thorough, and is, therefore, non-effective, if not actually injurious. Non-effective in the sense that the qualifications required for admission to membership are so broad as to be in a large degree meaningless; and injurious in that this absence of real significance is not realized by the general public, who would, naturally, be disposed to conclude the direct contrary from the fact that some sort of discrimination is now known to be exercised. Consequently the danger that Institute membership may be made to serve personal and improper ends is greater than before. The Council has, however, recognized and endeavoured to provide against, or at least minimize this possibility, by issuing at periodical intervals a list of the names of applicants, together with a statement of their alleged qualifications, to the membership at large, inviting members to scrutinize this list and to submit any criticisms they are in a position to afford concerning the status of candidates and which would affect their right to election. By this means the members as a whole are made to share with the Council any responsibility attaching to the admission of new members; but although these lists have now been issued for upwards of a year, as yet they have failed to elicit a single reply. Which, of course, presumes that all recent elections have been beyond reproach.

These, then, are in part the arguments for and against the present practice of membership classification. No doubt others could be adduced in support of contentions on either side. The question is worthy of consideration in view of the proposed revision of the by-laws this year, and it is to be hoped that members will take advantage of the present opportunity to present their views on the subject.

In conclusion, a word may be said on the Institute's recent policy of establishing branches throughout the country. The idea is not a novel one, even in the Institute, having been first suggested and partly carried into effect by Mr. Bell in 1902. It was also warmly advocated by Mr. Coste during his term of office in 1903 and 1904. The successful operation of the branch system, however, is of comparatively late date, and takes into account the organization of the Toronto, Cobalt, Montreal and Western branches. Of these, the Cobalt and Western branches are naturally the most important, and have served the most useful purpose; in fact, a large increase in membership during the past two years is chiefly due to the activities of these two branches, and of their executive officers, to whom the Institute is under considerable obligation. Until quite lately there has been much opposition in certain quarters to the establishment of branches, and even now some very able gentlemen hold the view that the expedient is a mistaken and dangerous one. Their ground for this belief is that branches foster and encourage localisms and sectional feeling; that they threaten to become a drain on the finances of the Institute, and, in brief, are likely to be a source of weakness rather than of strength. These ob-

jections contain, no doubt, at least a germ of truth, and it is well that they should be raised in order that any possible contingencies may be combatted before they actually arise. The Institute's chief claim to recognition, its power for good, is on the score of nationalism. As a national organization it is in a position to accomplish what would be otherwise impossible. This should be, and of course is recognized by every member, whether he belongs or not to a branch organization. The principle is precisely the same as that which governs the world by maintaining the individuality of nations. The branch, as such, is a small organization within a larger one, and its main function is comparable to that of a colony in its relation to an empire of which it is an integral part. Branches were originally established to meet conditions peculiar to this country. The centres of mining activity in Canada are widely scattered, and

spread across a continent. It was realized that a great majority of members could not, by reason of these great distances, attend meetings; that it was difficult to keep in touch with them from headquarters, and that consequently they were apt to become indifferent to the Institute, or lose interest in it altogether. The only feasible way to overcome these difficulties was to create enthusiasm by local organizations, and by providing machinery whereby men residing in the same locality might meet as members of the Institute in common cause. It was originally intended that these local branches should become more than this. So far, the plan has proved most effective; but nowhere as at Cobalt, thanks in part to the naturally favourable conditions and environment, but more especially to the enthusiasm, notably that of the secretary, Mr. Cole, of the men who have taken a prominent part in the organization and administration of the branch.

## THE DEVELOPMENT OF HEAVY GRAVITATION STAMPS.

\*By W. A. Caldecott, Member.

The history of ore crushing by means of gravitation stamps shows a progressive increase in their weight and in corresponding efficiency. This holds good in the development from the square wooden non-rotating stamps in use in Germany in the Middle Ages<sup>1</sup> to iron-shod wooden stamps in Cornwall, and then to rotary iron stamps in South Africa. The latter have greatly improved during the last few years, and probably represent the highest existing stage of development. About 1835, the first stamp mill in the United States was started at Tellurium, Virginia.<sup>2</sup> The stamps weighed 50 lb., and were made of square wooden stems with iron shoes and dies, the cams operating in slots in the stems.

Ten years later the Vauclease Mine installed 380-lb. stamps, of which the head weighed 125 lb. When the first batteries were erected on the Rand over 20 years ago, Californian practice probably represented the highest state of the art, and was introduced upon these fields by J. S. Curtis, J. H. Hammond and other well-known Californian mining engineers.

To illustrate the type of battery in operation on the Rand in 1889, in which year the writer's experience of stamp-milling began, the following details may be given of the Du Prez Gold Mining Co.'s mill, premising that this was before the introduction of the cyanide process, and that concentrators, other than blanket-strakes and buddles, were not in common use.

The mill was erected in that year, and was of Sandy-croft make, designed in accordance with the best Californian practice to date. It consisted of 20 stamps

weighing 900 lb. each when new, and was run at the rate of 90 7-in. drops per minute. The stamp duty was about 3 tons per 24 hours, using a screen of 900 meshes per sq. in.

By 1899 some progress had been made and 1,250-lb. stamps were in use at the Robinson Gold Mining Co. and elsewhere, though in Australia and the United States 900 lb. per stamp remained the almost universal maximum limit, and this remains true of the celebrated Homestake mills at the present time. At the Mount Morgan Gold Mining Co. (Westralia), in December, 1902, 30 stamps weighing 1,500 lb. each were erected. These were eclipsed, however, by the neighbouring Millionaire Gold Mining Co.'s battery of five stamps weighing 1,750 lb. each.<sup>3</sup> The advance made on these small companies was not generally realized, and in 1907 few stamps dropping on the Witwatersrand weighed above 1,250 lb., with the exception of certain batteries of Consolidated Goldfields companies, as will be noted later.

In 1904, the author was authorized by Mr. R. M. Catlin, Acting Consulting Engineer of the Consolidated Goldfields, to carry out a series of milling tests at the Knights Deep battery, which was equipped with stamps weighing 1,350 lb. when new. The object of the trials was to discover some means whereby stamp-milling efficiency could be increased.

The initial experiments were made to test the effect of fine breaking before stamp-milling, and also whether the increased discharge area afforded by a double discharge mortar-box increased the stamp duty. A pair of rolls was installed to effect the preliminary fine breaking, and also a double discharge mortar-box. A

\* Paper read before the Institution of Mining and Metallurgy.

<sup>1</sup> See Remarks by Bennett H. Brough, Proc. Inst. of Civil Eng., vol. cviii. (1892), during discussion upon paper by A. H. Curtis on "Gold Quartz Reduction."

<sup>2</sup> See Crane's "Gold and Silver," p. 473 et. seq.

staff of men was specially employed to carry out the trials, and most complete and detailed records were kept.

The tests extended over more than a year, and a considerable amount of money was expended in testing many variations of conditions, such as varied angles of screen frames, heights of discharge and of drop, and different methods of water introduction into the upper portion of the mortar-box.

The following statement illustrates some of the many experimental runs:—

|                                                                 | (A)<br>Single Discharge<br>Mortar.<br>Ordinary Mill<br>Feed. | (B)<br>Single Discharge<br>Mortar.<br>Ore from Rolls<br>set 0.5 in. apart. | (C)<br>Double Discharge<br>Mortar.<br>Ordinary Mill<br>Feed. |

The results of the above typical trials with a double discharge mortar-box and with fine breaking before stamp-milling are almost identical within the limits of experimental error.

The above conclusions were confirmed by the fact that the average stamp duty on ordinary mill-feed for six pairs of parallel trials was 5.82 tons with a double discharge mortar, and 5.82 tons with a single discharge mortar.

The average stamp duty for four pairs of parallel trials on the product of rolls set ½ in. apart was 5.64 tons with double discharge mortar, and 5.78 with a single discharge mortar. There was no increased duty to compensate for the extra cost of preliminary fine breaking,\* and the only difference with the double discharge mortar-box was a considerable increase in the amount of water used.

This last conclusion is in accordance with the fact that the ordinary single battery screen has about 40 per cent. of its area available for discharge, or, say, 1½ sq. ft. of discharge area for the small stream of pulp yielded by five stamps.<sup>5</sup> It will be observed that in trial (B) many flat pieces of ore which had passed the rolls set ½ in. apart yet remained on a coarser screen used in the grading analysis.

Finally it became obvious that to crush more rock it was necessary to strike a heavier blow. This was sought by affixing helical springs round the stem above the tappet so as to be compressed by the upper guide during the stamp's rise, and so that when released the

stamp would fall more rapidly, rendering a higher drop practicable, and would likewise strike harder. Whilst this object was in some measure fulfilled, the noise in the mill was much increased and the life of the springs did not promise to be long. Hence, finally, the conclusion was reached that a simple increase of stamp weight was the best course.

A series of runs were then made, whereby direct comparisons could be obtained of the actual tonnage milled by alteration in the weight of stamps. The table on p. 5 exemplifies the increased tonnage obtained by increased weight of stamp on ordinary mill feed, both under ordinary milling conditions and with a high discharge and back water feed to obtain a very fine product.

Another run with 1,337-lb. stamps having a height of discharge of 2 in. and a 64-mesh screen gave a duty of 10.23 tons per 24 working hours, of which 52.8 per cent. remained on a 60 screen. The water-feed adopted in this test consisted of inlets at an angle of 45 degrees at the back of the mortar-box, as suggested by the late Mr. H. T. Pitt.<sup>6</sup>

Encouraged by the results of these and many other tests, including a duty of approximately 6½ tons through 1,500-mesh screening with stamps weighted up to 1,622 lb., the writer felt justified in recommending that the next 360 stamps erected by Consolidated Goldfields Companies, namely, at the Simmer East, Robinson Deep and Luipaards Vlei, should have a weight of 1,550 lb. each when new.<sup>7</sup>

Such a departure excited much adverse comment among experienced millmen generally, on the ground that no foundations could stand the shocks, but the reasoning that if foundations could be built to endure the blow of the colossal steam stamps, it would be possible for them to be built to withstand gravitation stamps, proved correct. All the above mills are satisfactorily at work to-day after periods of service ranging up to three years, and the foundations promise to last as long as did their lighter predecessors.

In accordance with the present changed state of professional opinion, all Rand batteries lately erected or designed have stamps of a weight not long ago deemed extravagant, and aided by the installation of tube-mills, stamp duties of 8 tons are as common as of 4 tons but a few years previously.<sup>8</sup>

Whilst in the United States and in Mexico the relatively light stamp is still generally upheld, there is at least one notable exception in the recently built mill of the Boston Consolidated Copper Co., which is equipped with 312 single Nissen stamps of 1,500 lb. weight each and with a 9-ton duty.<sup>9</sup>

The accompanying diagram, Fig. 1, illustrates a modern heavy gravitation stamp with its mortar-box, as used in the Simmer Deep Jupiter joint mill.

The tabular statement illustrates the results obtained on a large scale under regular working conditions by the use of heavy stamps, and further shows in

the case of the Simmer East that whilst stamps alone can be used with a high discharge to produce a fine product, yet the later use of tube-mills as well yielded at the same total cost a product with fewer coarse

stamp batteries side by side in the Simmer East mill the one with a concrete block only, and the other with cast-iron anvil block as well, shown in the accompanying Figs. 2 and 3.

(+0.01 in.) particles, and hence a still more perfect exposure of the gold.

Somewhat later than the series of battery tests already described, the matter of battery foundations was also investigated. It was recognized that timber foundations were unsuitable for heavy stamps, their liability to decay rendering them less durable than the then recently introduced cast-iron anvil blocks. However, it had never been practically proved since the

The results of the parallel trials were on the average practically identical. These extended from the use of 100-mesh screening to 1,400-mesh, and the cast-iron anvil block battery showed an average stamp duty of 6.84 tons as against 6.78 tons for the concrete block, the average screen grading analysis of the latter showing, however, only 25.00 per cent. of + 60 (0.01 in.) grade as against 26.76 per cent. for the cast-iron anvil block.

The question of the life of the concrete block with

introduction of these anvil blocks that they were superior to concrete foundations in themselves, and that this point might be elucidated the author in 1906 had a series of 23 comparative trials carried out on two five-

out timber or a cast-iron anvil block has received attention also, and one mortar-box, erected on Mr. H. C. Behr's recommendation at the Simmer East Mill, upon a concrete block with only a thin layer of insertion

between, has been in use now for three years with no visible sign of cracking or deterioration. This has been so encouraging that at the Simmer Deep and Jupiter mills all the batteries have been erected with the mortar-box resting on the concrete blocks.

Crushing is usually performed either by impact or abrasion, and whilst hard ores are best dealt with by the former method, the latter is applicable to softer material. The relative efficiency of the two methods for hard material is well illustrated by the case of the diamond,

elastic limit of the ore, and rupture results.<sup>10</sup> The stamp is essentially an impact machine, and hence readily pulverizes hard tough ore.

Such ore, if handled in any of the legion of rubbing or shearing appliances, would only be reduced at the expense of serious wear by abrasion of costly steel parts which may have to be discarded when but a fraction of their weight has been worn away. With soft material the case is different, and machines of the latter class may be employed with advantage and without undue abrasion of wearing faces.

It is much to be regretted that no satisfactory machine for testing the capacity of material to resist abrasion, or conversely of testing the abrasive capacity of materials requiring abrasion, yet exists, as this property is of prime importance in all crushing operations.

When gravity stamps are used for very fine crushing they pass beyond the economic range, and operate by abrasion rather than by impact, with consequent reduction of efficiency, as may be seen from the following considerations. Impact is essentially dependent on the pressure exerted by the blow, and depends upon the

FIG. 2.

FIG. 3.

which is hardly capable of abrasion at all except by its own dust, whereas, if placed on an anvil, it will be shattered into a thousand fragments by one blow of a hammer.

As has been pointed out by C. de Kalb, the crushing of the larger pieces of ore in stamp milling is done as the result of reaction from the resilient die, the waves of compression transmitted through the ore from the shoe being reflected from the die, until the strains set up from the oncoming and reflected waves exceed the

weight of the stamp and the height of the drop. Assume that a 1,750-lb. stamp having a 9.5 in. diameter shoe and with a set height of drop of 8 in. strikes a layer of ore 2 in. thick on the die, and comes to rest 0.5 in. from the die. Then having fallen 7.5 in. and having done work for 1.5 in., it has exerted on the ore a mean total pressure of 8,750 lb.<sup>11</sup> The shoe having an area of 71 sq. in., the average unit pressure exerted over the whole of its area is only 123 lb. per sq. in., or less than that exerted by a man of average weight supported upon an area of 1 sq. in.

The crushing effect of such a pressure on hard quartz grains is trivial, and a certain amount of reciprocal abrasion of grains of sand re-arranging themselves under pressure is probably the main effect produced. The case, however, is quite different in the first impact of the stamp on the ore in the box. Assume that only a 2 in. cube resting on the die is first struck; having an

<sup>10</sup> See *Mines and Minerals*, p. 135, Oct., 1906; O. H. Howarth in *Mines and Minerals*, p. 441, May, 1906; and *Journal Chem. Met. and Min. Soc. of S. A.*, vol. vi, June, 1906, p. 385.

<sup>11</sup> Cf. Hiseox, "Compressed Air," p. 437.

area of 4 sq. in., the average unit pressure here is 2,190 lb. per sq. in., or eighteen times as much as under former conditions.

The finer the crushing is carried in the battery the longer sand particles remain before sufficiently reduced to escape, and the higher the ratio of fine to coarse material in the mortar-box. Hence, under these conditions the liability is for the falling stamp to have its force of impact distributed over so large an area as to produce little effect but abrasion on a bed of shifting compressible sand. These considerations serve also to explain why fine breaking before milling with heavy stamps does little good. A large number of pieces of ore of approximately equal size afford a large area to receive the blow of relatively small pressure upon each. And further, the abrasive action, above referred to, explains why stamp milling with a fine screen and a high discharge, or both combined, is inefficient through the waste of energy in converting fine sand into slime by abrasion of the particles re-arranging themselves under the stamp.<sup>12</sup>

As regards the desirable size to which ore should be broken before entering the mortar-box, the disadvantage of too fine crushing yielding a uniform bed has already been pointed out. The maximum limit varies with the class of ore, being less for hard ores, but in general it should be such that not more than one blow of a stamp is required to pulverize the largest piece of rock. Hence the heavier the stamp, the coarser the preliminary breaking admissible, and vice versa. With unweathered blanket ore probably a maximum diameter of  $1\frac{3}{4}$  in. is permissible. Larger pieces are more economically reduced by the rock-breaker and the lowering of stamp duty, owing to less actual height of drop with such a feed, is thus avoided.

In passing it may be said that the practice of placing the breakers under the control of the mine captain, who when ore is coming up freely from below avoids congestion in his bins by opening out the breakers wide, is not to be commended. The object sought is certainly achieved, but at the expense of inefficient stamp milling and greater strains on stems when the edges of the shoes fall upon large pieces of hard ore.<sup>13</sup> When the pieces of ore are too large to enter the feed opening of the mortar-box, and feeding consequently ceases, the results are of course even worse.

Taking the average running weight of a stamp as with a half-worn shoe and with a stem of less than its original length owing to breakage, it will be found that this weight is some 10 per cent. less than the weight of the stamp when new, and that its duty is correspondingly reduced. The obvious remedy is the use, as the shoe wears down, of compensating weights in some form or other, which have been frequently suggested and occasionally used.<sup>14</sup>

Since, however, greater attention has been directed to the weight of stamps through the trials on the Knights Deep referred to, the use of compensating weights has become common on the Rand, and their importance in maintaining a high efficiency and stamp duty is so considerable as to be well worth the small

additional trouble and expense involved by their use. Probably the earliest form of this device was placing an old head at the top of the stem or an extra tappet above the one in use.

These devices were, however, crude, and the writer has tried various other methods, including a false head intermediate between the true head and the shoe, on the ground that additional weight is better added near the bottom than near the top of the stem. Probably the most convenient compensating weights, however, are split cast-iron discs about 4 in. high and weighing about 50 lb. or 60 lb. each, which are clamped on the stem by means of two bolts either above or below the tappet. Such a compensating weight is illustrated in the accompanying Fig. 4, and as many may be gradually added as are needed and can be accommodated.

With increased weight of stamp, the question of increased shoe and die area arises, but the considerations already advanced, showing the small amount of pressure per sq. in. of total shoe area, indicate that very large shoe and die areas are not needed for hard ore whilst for soft ore a lower, quicker drop can be used. Some increase, however, is usual owing to the fact that the larger diameter of stems and tappets required with

FIG. 4.

heavier stamps necessitates increasing the distance between stamp centres.

An increase is desirable when the total force of impact of the falling stamp requires a thick layer of ore on the die to avoid excessive shock. Such heavy feeding lessens the duty, because the thicker ore bed reduces the actual height of drop, and the blow is likewise cushioned so that the stamp crushes by abrasion rather than by impact. As already shown, the cushioning caused by fine particles in the mortar-box increases with the height of discharge and the fineness of the screen.

The greater the force of impact per unit of area the coarser the screen required for maximum efficiency, as otherwise a thick layer of fine ore particles would be needed to avoid pounding. Since even a heavy stamp crushes but a very thin layer over the surface of the die it is obvious that the least thickness of ore layer necessary to take the impact of the stamp without pounding is sufficient to supply ample material for pulverization.

The prevention of irregular wear of dies is as yet an unsolved problem. At first sight it would appear that a slight cavity in the die surface due to soft metal would, when formed, be protected against further excavation by the surrounding portions of the die standing

<sup>12</sup> See E. A. Hersam's paper on "Economy of Power in Crushing Ore," published in the Mining & Scientific Press, of 16th Nov., 1907, p. 624; also C. de Kalb in Mines & Minerals, p. 136, Oct., 1906.

<sup>13</sup> See T. A. Rickard's "Stamp Milling of Gold Ores," p. 151.

<sup>14</sup> See Lock's "Gold Milling," p. 109; also Journal of Chem. Met. & Min. Soc. of S. A., vol. ii, April, 1898, p. 299.

above it, but in practice no such protection seems to be afforded. The cavity grows steadily deeper with use, and even turning the dies regularly is not a cure.

In the writer's opinion the trouble is due to the larger pieces of ore, or pieces of steel such as drill ends, gravitating in the swirl of pulp in the mortar-box to the lowest point, that is into any slight depression originally due to softness of the metal, and thus the impact of the falling stamp is transmitted to gouge out the bottom of the cavity. Such irregular wear is especially liable to start at the back of the centre dies where the ore feed first lodges and is thus struck whilst at its largest size.<sup>15</sup>

Consequent upon the introduction of tube-mills, coarse battery screening has generally replaced the finer mesh, and thanks to the work of this Institution, and of the Chemical, Metallurgical and Mining Society of South Africa, more accurate descriptions are now applied to screening,<sup>16</sup> with the result that the millman can with some certainty obtain a duplication of a previous order.

In accordance with the demands of the modern millman armed with a micrometer gauge, manufacturers' catalogues, in place of giving vague trade terms, now detail diameters of aperture, wire and so forth, with a most laudable desire for extreme accuracy.

Since this development, however, the general introduction of secondary grinding by means of tube-mills has lessened the importance of the battery screen as a criterion of the degree of reduction of an ore, and, in fact, the grading analysis of the final pulp leaving the crushing plant as an overflow of the hydraulic classifiers is now the guide to the metallurgist.

As pointed out previously before this Institution, this change makes the degree to which a particle is reduced dependent on both its diameter and its specific gravity, instead of on the former only, with the result that the pyritic material undergoes that finer comminution and more perfect exposure of gold contents which its greater value renders desirable.<sup>17</sup>

Breakages of cam-shafts as well as stems and other battery parts are still commonly described as being due to "crystallization" set up by vibrations incidental to the operation of crushing. At the present day, however, such an explanation cannot be accepted, it having been proved that repeated shocks in time develop, in such essentially crystalline aggregates as iron or steel, minute microscopic crevices which gradually extend until a fracture results.<sup>18</sup>

Among the few who have initiated improvements in stamp mill design of recent years is that experienced millman, M. P. Boss, whose design of a stamp with long head, thus giving strength at what would otherwise be a weak point in the stem, is worthy of serious investigation.<sup>19</sup> It is somewhat remarkable that whilst the number of crushing machines invented to supersede stamps is endless, and much space in metallurgical publications is devoted to the description of crushing plants, yet the actual operation of the gravitation

stamp and the discussion of its most appropriate design has been but little dealt with either by the skilled engineer or by the mathematician.

In order to employ heavy gravitation stamps to full advantage, it is absolutely necessary that a uniform speed should be maintained by proper governing of the engine. Only under these conditions can the maximum speed and height of drop be safely used without fear of camming; and the damage done in a few moments by sudden increased speed above the normal may prove a costly matter both in loss of time and material. Further, with heavy stamps the use of five-stamp cam-shafts is very desirable, in that as compared with ten or fifteen-stamp cam-shafts both the power to be transmitted and the number of shocks due to lifting stamps are reduced by one-half or two-thirds for each shaft.

Many attempts have been made to supersede the use of gravitation stamps as the standard machine for the crushing of gold-bearing ore, but without success. That, in spite of certain obvious disadvantages, they still hold their own, is probably due to the fact that pneumatic and steam stamps as hitherto designed have proved wasteful of power and liable to derangement under the vibrations and shocks inevitable during crushing, whilst the gravitation stamp has little to go wrong, and power can be cheaply developed by a complex and economical steam-engine removed from unfavourable conditions and tended by a skilled operator without other duties. A serious effort is, however, now being made to utilize a new type of Holman pneumatic stamp at the New Kleinfontein mill, and there is no doubt that the energy and experience of those concerned in this test will, if it is possible, overcome such difficulties as have been encountered in the past with similar crushing appliances.

From the foregoing discussion it will be evident that the day of the stamp as a unit of crushing capacity has passed away. The unit of the present basis is the tonnage crushed per month or per day, and this is dependent on many factors—the relative proportion of stamps to tube-mills, the actual running weight of the stamps, the ratio of water fed, the height of discharge, the height and number of drops per minute, the screening used, and the maintenance of "concert pitch" in the mill engine.

The future limit of stamp weight is difficult to foretell, but it will probably be determined more by the mechanical considerations involved, as in the cam system of lifting, than by any decreased relative efficiency as a device for pulverizing ore.

The advantages of heavy stamps, as compared with lighter ones, may be briefly stated as follows:—

1. Reduction of the initial capital expenditure in erecting, say, 200 stamps at 1,750 lb. with accessories, in place of 280 stamps at 1,250 lb. each.
2. Reduction in size of mill building, almost proportionate to the less number of stamps.
3. 30 per cent. less shafting, belts and other moving parts to maintain.
4. 30 per cent. less labour required for dressing plates, lubricating moving parts, changing screens, and other work incidental to milling operations.

In concluding this somewhat lengthy, yet incomplete discussion of some of the factors affecting present day stamp-milling, it is my pleasant duty to acknowledge my indebtedness to the Consolidated Goldfields of South Africa, whose foresight provided means whereby a departure was rendered possible which, besides bene-

fitting the gold mining industry in general, has enabled them to claim "the heaviest stamps and the highest average stamp duties of any gold mining corporation in the world;"<sup>20</sup> and to Messrs. R. M. Catlin, H. H. Webb, and H. C. Behr and their staffs for greatly appreciated encouragement and suggestions during the progress of the experimental work detailed.

### A MODERN MINING PLANT ON THE RAND.

The following extract from the South African Mining Journal, describing the plant on the Simmer Deep-Jupiter, is most interesting. The reader will notice that many new features are incorporated in the equipment:—

"This plant has the distinctive feature of being entirely driven by electricity from the stamps right down to the last pumps in the extractor house. The 300 stamps, each of which weighs 1,670 lbs. when new, are driven in lots of 10 by separate three-phase motors of about 50 h.p. The drop is about 8½ ins. The pulp, after passing over the amalgam tables, is pumped to 12 classifiers. The underflow from these goes to four tube mills, 22 ins. by 5 ft. 6 ins., driven by separate 125 h.p. three-phase motors. The overflow from the classifiers gravitates to 12 conical sands separators. Here a complete separation of the slimes from the sands takes place. These sands separators are 6 ft. in diameter by 6 ft. 6 ins. They are provided with a movable diaphragm about 2 ft. from the nozzle to regulate their action. The underflow from these separators is pumped to a set of eight conical de-watering cones, 8 ft. 6 ins. by 9 ft. deep. The overflow from these cones passes to two others, the underflow from which gravitates back to the mill tailings launder, and the overflow goes to the slimes plant. It is being found that four of these cones are sufficient when run in conjunction with the two cones last referred to. This part of the plant was in the nature of an experiment, the outcome of which was more or less assured.

"The underflow from the de-watering cones, containing about 33-35 per cent. of moisture, is delivered on to the two continuous vacuum filters that are the feature of the plant, and were from the design of Mr. W. A. Caldecott, the consulting metallurgist to the Consolidated Gold Fields Group of Mines. These filters are in the form of circular tables, 29 ft. in diameter, the filter bed being 2 ft. 6 ins. wide, giving an area of 137 square feet, and make one revolution in about three minutes. Thus, a 1½ in. layer of sand is run on to the bed. A pump, giving a vacuum of about 7½ ins. of mercury, by withdrawing the air and water from below the bed, reduces the moisture in the sand to 16-17 per cent. A plough arrangement removes the dried sand from the bed. There are two of these filters at work, and they treat from 1,200 to 1,400 tons of sand per day. The filter bed is made by placing coir matting on slats about 4½ ins. apart. Unbleached calico is placed on top of the matting. The filter has to be renewed once in 24 hours, the time taken being about 45 minutes. The dried sands are mixed with a .025 to .030 per cent. KCN solution, and pumped to one of 8 sands tanks, 8 ft. 3 ins. by 50 ft., where they are distributed by the 'Butter and Mein' apparatus. These tanks are capable

of holding 750 tons of dry sand. The overflow from these tanks goes back to be mixed with more dried sand. The sand is given from two to three days' treatment, this being facilitated by applying a vacuum pump, the solution being finally delivered to two storage tanks of the same size as the sands tanks prior to going to the extractor house. When these tanks have been drained the sand is removed through holes on to shuttle belts 32 ins. wide, which in turn deliver to the two main belt conveyors 28 in. wide. There are six of these shuttle belts, but only three are used per tank at a time. The belt conveyors take the sand to ten sands leaching tanks (Blaisdell distributors being used), the first solution applied being about .12 per cent. KCN and the final about .025 per cent. KCN. From here the sands are taken by 20 cubic ft. trucks to the dumps. The circuit of the sand from the mill to the dump is only about 6½ days. From the time the sands are delivered from the mill to the time the sands are charged into the sands tanks is only about two hours. The advantage of this system is therefore obvious. The ordinary time taken is almost ten days for sands treatment.

"There are 16 tanks at the slimes plant, these being 70 ft. by 12 ft. to 17½ ft. deep at the centre, and are about the largest at present in use. Their capacity is about 400 tons of dry slime. A 12-in. centrifugal pump with 16 ins. suction and delivery can transfer 400 tons of dry slime with 43 per cent. of moisture in about 50 minutes. There are two of these pumps. A notable feature of this slimes plant is that the whole of the operations can be overlooked from a small building in the centre of the plant. All the solution from the slimes plant is passed through filter presses, of which there are three of 48 frames, 32 ins. by 32 ins., to remove any calcium carbonate and other matter that would interfere with or foul the precipitation. There are eight zinc boxes for the slimes solutions, and these treat about 2,500 tons of solution per 24 hours. There are 12 zinc boxes on the sands side of the extractor house, but only a portion of them are in use. About 66 per cent. of the dissolvable gold goes into the .025 per cent. KCN solution first mixed with the sand. This solution usually runs from 1.8 to 1.9 dwt. per ton, and only assays .01 dwt. on leaving the boxes. Separate boxes are kept specially for this solution. The sands themselves usually run about 3-3½ dwts. per ton. Other boxes are, of course, kept separate for the strong and the weak solutions. Three more tube mills will be installed shortly, as well as three new slimes settling tanks, two of which are in course of erection. This extension of the slimes plant has been found necessary from the increased length of time required to settle the slime in winter, and especially that from the dump rock now being partially milled. Next winter, when it is expected only fresh rock will be milled, the plant as extended will be capable of treating the 66,000 tons per month—its nominal capacity."

### ELECTRICAL POWER FOR RAND MINES.

The project for producing electrical power at the pitheads of the local coal mines in the neighbourhood of Johannesburg is one which promises commercial success in consequence of the contracts entered into with the Eckstein, Consolidated Gold Fields of South Africa, General Mining and Finance, Messrs. Goerz & Co., and other groups for a period of 20 years. The

<sup>20</sup>See Annual Report of the Consolidated Gold Fields of South Africa, Ltd., 1908, p. 30.

contracts entered into are estimated to amount to 100,000,000 units a year, with an ultimate requirement of 500,000,000 units, making this the largest electrical installation in the world. The Kalgoorlie Electric Company supplies many of the Kalgoorlie mines with power, also the Tramway Company and the Townships of Boulder and Kalgoorlie, and only requires 10,000,000 units annually. In comparison the magnitude of the land's requirements is fifty times as great. The price at which the contracts have been taken allows a substantial profit to the Power Company, even on the basis of the smaller supply now being generated, but with the enormous increase to be provided by the end

of 1910, the reduction of costs should allow a larger margin of profit, and still effect a considerable reduction in power costs to the mines. Seeing that many of the contracts involve the scrapping of large steam plants now at work on the largest mines, it is certain that such would not have been done if a considerable advantage were not assured through the change, but it will mean much more to such mines as the City Deep and all new mines, as it will save them the large expenditure for motive power in all their operations. New mines will, therefore, require to provide much less working capital than when they had to provide huge steam engines.

## EXCHANGES.

### **The South African Mining Journal, August 21, 1909.**

The S. A. Mining Journal pleads for concerted effort on the part of syndicates in prospecting for petroleum. It urges also upon the Geological Survey Commission the propriety of bestirring themselves in the same cause. In the same article our contemporary expatiates upon the origin of oil, referring to the distillation of petroleum from coal as the result of the intrusion of basaltic dykes as an established fact. We commend to the writer of the article Mr. Coste's paper on the origin of coal and petroleum.

### **The Colliery Guardian, September 10, 1909.**—Refer-

ring to the renewed crisis in the collieries of South Wales, the Guardian reminds its readers that it, the Guardian, stood alone in taking a less sanguine view of the Cardiff settlement, June 30th, which was heralded as a triumph of conciliation. Mention is made of the secular letter, recently issued by the Coal Owners' Association. Continuing, the Guardian wisely points out that "there can be no useful purpose served by attempting to discount the gravity of the situation. The fact is that the [Eight Hours] Act is practically unworkable in South Wales, and the position of the collieries has been rendered quite unworkable by the unreasonable and dictatorial obstruction of the workmen and their representatives. Everybody connected with the trade . . . is becoming unnerved by the uncertainty and insecurity of the market."

### **The Mining Magazine, Volume 1, No. 1, September,**

1909, (London, England.)—Many features of interest are set forth for attention in this first number. The Review of Mining occupies the first eight pages. Here are discussed the current mining affairs of South Africa, West Africa, Australia, Mexico, and other countries. Fourteen editorial pages follow. It may be noted that the last editorial, "The Price of Copper," indicates that The Mining Magazine believes that "production appears likely to keep pace with any anticipated consumption;

therefore, there is no reason to expect an increase in the price of copper, although there is no immediate fear of a further decline." Next comes the section assigned to "Special Correspondence." The letters from Johannesburg, Mexico, San Francisco, Denver, New York, and Redruth are good stuff. They are not merely a record of work done; they give one a bird's-eye view of general commercial, technical, and political conditions. "Metal Markets" and "Discussion" are followed by 28 pages of technical and general articles. Then, after five pages of summarized company reports, we find the same amount of space devoted to a "Précis of Technology," in which are numerous digests of current monographs, and bulletins. Three minor departments, "Current Literature," "Books Reviewed," and "New Publications," complete the magazine.

### **The Engineering and Mining Journal, September 18,**

1909.—The relation of mine explosions to earthquakes is a topic that generated a certain degree of heat between the Engineering and Mining Journal and that most respectable monthly, Mines and Minerals. Their exchange of editorial grape-shot was noted in these columns. The E. and M. J. held that the hypothesis that there is connection between the two phenomena is not unreasonable, and is supported by substantial arguments. Mines and Minerals laughed the laugh of scorn. Seemingly that laugh was premature. In the current number of the E. and M. J., Mr. W. A. Spalding develops a strong case for the existence of a connection between mine explosions and seismic disturbances.

A mine explosion, says Mr. Spalding, is not a natural phenomenon. It arises from a natural condition plus an artificial condition plus an accident. Now, although earthquakes are localized by the region of least resistance or of greatest pressure, seismographs inform us that minor tremors pass entirely round the earth, and are recorded thousands of miles away from the centre. . . . "A mine is an artificial pocket in the earth. At a time when gases are driven forward by compression—

when the earth's crust is flexed, buckled, broken by seismic action—what assumption is more natural than that they should find exit through seams and fissures to this place of least resistance? . . . There are times when, without any apparent local cause, underground chambers become filled with gas. Whether such gases are explosive or not, whether it requires the admixture of air or coal dust to render them explosive; whether they are actually exploded or not, is entirely foreign to the argument. We are simply tracing natural causes which supply the conditions favourable to accidents of this sort. . . . That the mine in which an explosion occurs is far removed from the locality of a proximate or concurrent seismic disturbance does not discredit the theory of relationship, in view of the wide range of stresses and strains previously discussed."

Mr. Spalding concludes his paper by quoting a series of Associated Press dispatches concerning the roaring well near Beloit, Wisconsin. The well was active for two weeks before the San Francisco earthquake and ceased on the day of the catastrophe. It appeared also to synchronize with the earthquake in Mexico. Similar phenomena have been noted in France.

### BOOK REVIEWS.

**Ore Dressing.** By Robert H. Richards, S.B., LL.D. Volumes III. and IV. Price, \$5 per Volume. The Set, 4 Volumes, \$20 (£4 4s.) net, postpaid. McGraw-Hill Book Company, 239 West 39th Street, New York.

To very few of our readers are any words of introduction necessary when mention is made of Richards' "Ore Dressing." The first two volumes appeared in 1903, and were regarded as practically a complete presentation of the subject. Changes, improvements, and investigations, however, have multiplied so rapidly in the art of concentrating ores that Dr. Richards determined to add a small supplement to the two volumes. Work on this was commenced in October, 1906.

So much material was collected that it soon became apparent that a new work, ranking in size with the previous volumes, would be necessary to cover the ground. The new work has therefore taken the form of Volumes III. and IV., in which the subject matter of Volumes I. and II. is added to, chapter by chapter.

Beginning with chapters entitled "General Principles" and "Preliminary Crushing," Volume III. treats successively of rolls, stamps, pulverizers, laws of crushing, preliminary washing, sizing screens, classifiers, hand-picking, jigs, fine sand and slime concentrators, amalgamation, miscellaneous processes of separation, and accessory apparatus. Short chapters on the laws controlling screening, classifying, and jigging appear also.

Volume IV. consists of two long chapters—Chapter XLI., "Summary of Principles and Outlines of Mills," and Chapter XLII., "General Ideas on Milling." In the former chapter 94 mills, representing milling practice in the principal mining centres of the world, are described. The latter chapter gives much practical information as to costs, power tests, process tests, etc., etc. Volume IV. concludes with an appendix of useful tables and an exhaustive bibliography. Bibliographies are also appended to every chapter.

Nearly every type of ore-dressing machine is noted by Dr. Richards. The numerous diagrams and half-

tones that illustrate the text are exceedingly useful. Whatever minor details the work may be open to criticism, it is, beyond question, one of the most complete and the most satisfactory of text-books.

There is always danger of the mine manager becoming enamored of one particular type of machine. Not seldom the agent's personal charms are the deciding factors in the manager's choice of equipment. This is particularly apt to be the case in isolated camps.

There is no doubt that the manager can best fortify himself to withstand the blandishments of the machine agent, and can most readily qualify himself to make a wise choice of equipment by arming himself with a copy of Richards' "Ore Dressing." He will then have at his disposal an array of facts and figures far greater than he can have accumulated in his own personal experience.

This, possibly, defines the function of the volume before us. They are guides to the engineer and millman. They give, in concentrated form, all available data concerning the principles and practice of ore crushing and ore concentration. While it is humanly impossible to make any such treatises absolutely comprehensive and exact, these volumes come well within both categories.

### CANADIAN PATENTS.

The following is a list of patents issued by the Canadian Patent Office on Sept. 7, relating to mining and metallurgy, and furnished by Fetherstonhaugh & Co. 5 Elgin St., Ottawa. Russel S. Smart, Resident:—

120338. A Meyer, J. W. Allison, St. Louis, Mo., apparatus for rolling wire glass and the like.

120339. Ditto.

120354. A. R. Frank, H. A. Halensee, Max Voigt, Friedenau, Germany, apparatus for manufacturing nitrogen compounds, Societa Generale.

120356. J. F. Monnott, New York City, compounds metal bodies and processes of producing same, Duplex Metal Co.

120371. A. A. McIsaac, P. McKinnon, Broad Church, N.S., safety devices for mine riding rakes.

120391. J. Hartness, Springfield, Va., methods of turning metals.

120392. Ditto for means of turning metals.

120393. W. J. Hough, Toledo, Ohio, processes of recovering precious resinous matter.

120414. W. C. Sharpe, Jr. and Sr., Eastfield, Louth, England, apparatus for the production of air gas.

### PERSONAL AND GENERAL.

Mr. Allan Greenwell, editor of the Colliery Guardian, London, left Toronto en route for England on Sept. 22nd.

Mr. Reginald E. Hore, of the Michigan College of Mines, has returned from Cobalt district. Mr. Hore leaves for Houghton in a few days.

Mr. H. G. Carmichael, McGill '08, who is in charge of the operations of the Night Hawk Mining Company, on Night Hawk Lake, passed through Toronto on Sept. 20th.

Mr. C. L. Constant, Jr., of C. L. Constant & Co., the newly organized firm of mining engineers and metallurgical chemists, 42 Broadway, New York, passed through

Toronto on his way to Cobalt. The object of the organization has been to gather together a number of recognized mining specialists qualified to deal with all the details of exploiting and operating mining properties and smelting propositions. The directors are the following: C. L. Constant, president and treasurer; Dr. Walter Harvey Weed, vice-president; C. L. Constant, Jr., secretary, and R. B. Lamb and Frank H. Probert.

### ARCTIC AMENITIES.

Where boreal breezes blow,  
Where lies eternal snow,  
There Peary, don't you know,  
Vows Cook did never go!

Where flares the Northern light  
To illumine the Polar night,  
There Cook, with all his might,  
Swears that he got all right!

Cook claims an errant cake  
Of ice him safe did take  
Just where the Pole all naked  
-D stands without a quake.

And Cook asserts that hog—  
That Peary—pinched his prog  
From out a cache of log—  
The most unseemly dog!

And now there's not a soul  
Cares aught about the Pole—  
That source of direful dole!  
That vaguest, vainest goal!

Our object, one and sole,  
Is not to find the Pole,  
But just to let the whole,  
Damned business drop!

## Industrial Notes.

Nine Deister tables and slimers are being placed in the new addition to the Coniagas mill, Cobalt, Ont; eight in the enlarged McKinley-Darragh mill, and two in the Temiscamingue new mill.

### THE SULLIVAN MACHINERY COMPANY.

The Sullivan Machinery Company announces that the Northern Canada Supply Co., Ltd., of Cobalt, Ontario, has been appointed agent for the Sullivan Machinery Company, covering Cobalt and other northern Ontario mining territory. Mr. Robt. T. Walker has associated himself with the Northern Canada Supply Co., and will give his attention to the sales of the Sullivan Rock

Drills, Hammer Drills, Air Compressors, Diamond Core Drills, etc. A liberal stock of these machines and their parts will be maintained at Cobalt, with improved facilities for serving customers.

### A NEW INVERTED TYPE ASSAY BALANCE.

Recently in America there has been a revival of the inverted type balance, one of the earliest designs of European makers of precision balances, although now given an inferior position in their line, due largely to the more energetic development of the familiar type with dependent pointer or indicator.

The accompanying illustration shows a new model just put out by a leading maker and having numerous improvements over existing types.

The beam is of truss design, and made of hard rolled magnalium, an alloy equal in strength and of about one-third the weight of the brass or bronze commonly used, effecting thereby a reduction in the inertia of the moving parts, with a consequent increase in speed and sensibility.

The rider carriers have no metal-to-metal surfaces in sliding contact, hence are smooth in operation under adverse working conditions. The graduations are in

hundredths on a celluloid index, each division representing 1-100 of the weight of the rider used.

The end bearings are of one solid piece of agate, supported by agate contact points when at rest, and the releasing mechanism is of improved design, thereby eliminating the disadvantages of earlier balances of this type, operating absolutely without "kick."

The unit base carries the entire mechanism above the glass base, and maintains its perfect alignment under all conditions, and having less than one-half the parts of other balances of this type, its simplicity and the ease with which all parts may be removed for cleaning and replaced without disturbing their adjustment will appeal to the user at a great distance from the factory.

This balance is made by Wm. Ainsworth & Sons, makers of balances and engineering instruments of precision, Denver, Colorado, U.S.A., and is fully described in Bulletin A-16.

## SPECIAL CORRESPONDENCE

## ONTARIO.

**Cobalt.**—The results of the sale of 349 acres of mining lands in the Gillies Limit have been announced. Twenty parcels of land were offered, and of these fifteen were sold. Tenders received for the other five lots were not considered high enough, and were therefore not accepted. The fifteen lots sold brought in a total of \$109,943.50. In addition to these fifteen lots the Provincial mine was sold to F. M. Connell, of Haileybury, the purchase price being \$113,111, making the total proceeds of the sale \$225,054.50. In addition to the sale price a royalty of 10 per cent. of the gross proceeds of the sale of ore will be levied. The successful tenderers were as follows:—

|                                            |            |
|--------------------------------------------|------------|
| Lot A, 5—Geo. F. Webb, Hamilton, Ont. .... | \$7,709.00 |
| “ A, 8—Ben Sommer, Montreal .....          | 7,447.50   |

| “ A, 38—Bannell Sawyer, Montreal .....     | 5,011.00   |

The Buffalo mine has been working for a long time on its cyanide plant, to be used in connection with the concentrator, and at last has it in running order. The new plant has a capacity of 50 tons per day. For the treatment of the slimes a combination of mechanical and air agitation is used. The millmen of this district will watch the operation of the plant with a great deal of interest, as many of them have carried on extensive experiments along this line, and have come to the conclusion that a commercial success cannot be made of the cyaniding process as applied to cobalt ores.

It was stated a short time ago that development on the Waldman vein in the Gillies Limit had not been productive of very encouraging results. When the shaft was down about 15 feet the vein changed to calcite with a streak of barren cobalt, but when the work was down an additional fifteen feet the high-grade ore came in again, carrying practically as good values as were found on the surface. Sinking will be continued to the 100-foot level before any drifting is done, and in addition to this two diamond drills will be operated on the property in an effort to locate new veins. This company is at present leasing air from the Provincial mine, but as this property has now been sold, it is altogether likely that new arrangements will have to be made. It will not, however, be necessary for them to install their own plant, as the main pipe line of the Cobalt Hydraulic Power Co. passes within 100 feet of the property.

The 10-stamp concentrator at the Colonial mine has been completed, and the company is only awaiting the arrival of the air and electricity, when work will be started. Last spring mining operations were suspended, and since that time no work has been done.

It is generally understood that Montreal capitalists who are identified with the Crown Reserve mine have obtained control of the Silver Leaf, and the recent appointment of Colonel Carson, President of the Crown Reserve, and Mr. Cohen, who is manager of the same company, to the positions of president and consulting engineer respectively of the Silver Leaf, would seem

to point to the truth of these rumours. It was believed that the shares of the Silver Leaf were very widely scattered, but it now appears that the controlling interest was held by some New York people, and that they have sold the same at a price low enough to induce the buyers to consider the property. The Silver Leaf is capitalized at five million dollars, and up to date only about \$300,000 worth of ore has been mined. The main vein of the Crown Reserve continues into the Silver Leaf, but shortly after crossing the boundary the values pinched out.

Progress is being made with the addition to the Coniagau concentrator, which will double the capacity of the plant. A large part of the machinery is already on the ground, and the management is confident of having it in operation by the end of the year, provided the power companies have their electricity ready for distribution by that time. The addition has been designed to use electric energy, and the steam power equipment is only sufficient to operate the existing plant.

Part of the machinery for the extension to the Northern Cus-toms Concentrators has been installed, and the results obtained were very satisfactory. Two Nissen stamps were running for a short time to get an idea of their capacity. These were installed by the inventor under a guarantee to crush a certain amount of ore a day, and in the test that was given them they exceeded the guarantee.

The Townsite mine only commenced operations a short time ago, and up to date the results obtained have been very encouraging to the management. A new vein about 3 inches in width was discovered at the 110-foot level on the No. 7 shaft. It consists of cobalt carrying high values in silver. In a short time a cross-cut will be run to the west to catch a continuation of one of the main veins of the Buffalo. At the present time the main part of the work is being carried on from the Silver Queen shaft, where the company is stopping out a vein that cuts across the corner of the Townsite property, and already a considerable amount of high-grade ore has been taken out.

It is reported that one of the best veins on the Mann property in Gowganda was discovered Sept. 3rd. The new vein, which has been traced for some distance, varies in width up to 4 inches, and consists of high-grade ore.

Another drilling contest was held in Cobalt on Labour Day, Sept. 6th, and the first prize was awarded to the Nova Scotia team, who drilled 38½ inches. In a similar contest held a couple of weeks previously this same team was only able to drill 25¾ inches. All the other competing teams made a similar advance above their previous records, and this is largely due to the great strides made since the former test, when they were so hopelessly outclassed by Page and Pickens, the world's champions.

A short time ago a deputation representing several of the Cobalt mines called upon the officials of the department and petitioned that the heavy royalties which these have to pay should be reduced. Although no announcement has as yet been made, there are indications that such a reduction will be made. Should such be the case, the following mining companies would be benefitted: Chambers-Ferland, 16 per cent. royalty; Crown Reserve, 10 per cent.; O'Brien, 25 per cent.; Temiskaming & Hudson Bay, 15 per cent. Besides these companies paying a royalty to the Ontario Government, the following companies have to pay a similar royalty to the T. & N. O. Railway commission. These are: Right of Way, Townsite, Nancy Helen, City of Cobalt, Station Grounds, Jackpot, Wright and Railway Reserve, all of which pay 25 per cent.

Since the installation of the new 6-drill compressor at the John Black Mining Co. the work is progressing much more

rapidly. At the present time drifting is being carried on at the 100-foot level, and some good ore is being taken out. The shaft is being sunk to the 200-foot level, and from that point a cross-cut will be run about 300 feet, where it is expected to cut the Ophir vein. Several new camp buildings are being erected.

It is understood that the Cobalt Lake will ship a car of high-grade ore in a short time.

The Silver Mines Exploration Co. has declared its regular dividend of  $1\frac{1}{2}$  per cent., and an extra bonus of  $3\frac{1}{2}$  per cent., payable Sept. 16th.

The Crown Reserve Mining Co. has declared its regular quarterly dividend of 6 per cent., and also an extra bonus of 9 per cent. On August 30th the cash on hand and ore in transit amounted to \$912,000. After paying the quarterly dividend the surplus will be \$647,000.

The Buffalo Mines has declared its regular quarterly dividend of 5 per cent., payable Oct. 10th, and an extra dividend of 3 per cent., payable Nov. 5th. Up to date this company has paid 59 per cent. of the capitalization.

The Temiskaming & Hudson Bay Mining Co. has declared a dividend of 300 per cent.

A 5-drill compressor has been installed at the Last Chance mine, which is located near the town of Latchford. This company has lately found good values at depth, and the force of men has been doubled and the work is being pushed as rapidly as possible.

At the present time there is a force of nearly one thousand men engaged in the construction of the plant of the Mines Power, Limited, and good progress is being made in the different branches of the work. The poles for the transmission line have been erected, and the work on the sub-stations for the distribution of the air and electricity at Cobalt and Kerr Lake is making good headway. The Cobalt sub-station is being built on the Nipissing property on the south side of Cobalt Lake, and the one which is to serve the Kerr Lake district is being built at Brady Lake. Large compressors will be installed in both these sub-stations, and air will also be connected by a 10-inch main, so that in case of breakdown at either place, there will be no interruption of the supply of air.

At the eleventh hour the Provincial Government has realized the gravity of the fever situation in Cobalt, and has sent several special inspectors to look after the work of cleaning up the town. A great many nurses have been sent in from outside points, and a number of tents have been erected to serve as hospital camps. It is hoped that the methods now being employed, together with the colder weather, will be successful in checking the disease.

Active development work is being carried on at the Temiskaming & Hudson Bay, and it is understood that several very promising discoveries have been made within the past few weeks. In a short time the management expect to sink a winze below the 200-ft. level, and from the bottom of this drifts and cross-cuts will be run to catch several veins. A few days ago the Coleman Township properties of this company were transferred to the Hudson Bay Mines, Limited, which has a capital of \$3,500,000.

At the Nipissing Mine, vein No. 122, which was discovered on the surface some time ago, has been traced for 820 feet. This vein has been cut underground at two points, 520 feet apart and 80 feet below the surface and in both places shows high grade ore.

Some excellent samples of niccolite ore were recently brought into Cochrane. These were stated to have been broken from an outcrop a few miles from the town. It was in this section that the International Nickel Co. were working diamond drills on a large nickel deposit on which they had an option.

Some time ago the machines were taken off, but no announcement has been made as to the results obtained.

Mr. W. P. O'Brien, on behalf of the Imperial Crown and Silver Leaf, denies the report that these companies will amalgamate. A special general meeting of the Silver Leaf Co. will be held in Toronto on Sept. 27th to confirm by-laws passed by the directors.

Recent development at the Silver Cliff mine has much improved the outlook at that property. Drifting is now being carried on on Nos. 1, 2 and 3 veins, and some very good ore chutes have been encountered. At present operations are confined to the main tunnel, which is now in 400 feet. A winze has been sunk to a depth of 80 feet below the tunnel, and from the bottom a cross-cut is being run to catch the No. 1 vein. The foundations for the new concentrator have been started, and the work will be pushed as rapidly as possible.

During the past month a large number of prospectors have been going into the new gold fields in Whitney Township, which is 65 miles by canoe from Driftwood City. A large number of claims have been staked, and some very fine specimens of gold quartz brought out. The veins in this section are very similar to those in Munro Township, and are narrow, but rich.

The addition to the concentrator at the King Edward mine is now complete, and the company only await the delivery of power in order to re-commence operations. There is a large quantity of milling ore on hand but as the enlargements to the concentrator were made with a view to using electric power, operations will be delayed for some time.

On Sept. 15th the assay building at the Trethewey mine was destroyed by fire. The prompt action of the brigade from the Coniagas was undoubtedly the means of preventing some of the other buildings being burnt.

The Nipissing Central Railway, which is to connect Cobalt, Haileybury and New Liskeard, expect to have their rails laid by the last of November. The contract has been given to the Algoma Steel Co., and several carloads have already been received. The contract for four passenger cars has also been let. The only hitch at present is over the bridge crossing the T. & N. O. tracks on the southern edge of Buck Township, and it is expected that this matter will be settled next week by the Railway Commission.

The trouble between the Nova Scotia Mining Co. and the Peterson Lake Mining Co. has culminated in an action against the Nova Scotia for the recovery of one million dollars, and to restrain the Nova Scotia from trespassing on the Peterson Lake property. The report of the Peterson Lake engineer shows that the Nova Scotia has trespassed upon the Peterson Lake property not included in its lease, and has removed a large quantity of ore to which it had no title. The report also shows that the ore was handled without regard to the Peterson Lake interests, and that due care was not exercised to separate the ore taken from the different properties. It also appears that no returns were made to the Peterson Lake from one car of ore shipped from its property, and that improper deductions have been made in freight and smelting charges. The trouble is partly the outcome of the want of independent management of the two properties. The Nova Scotia has been working one of the Peterson Lake claims on a royalty basis. The annual meeting of the Peterson Lake Co. will take place on October 6th.

About twenty-six miles of the wagon road between Elk Lake and Gowganda has already been completed. The road is in first-class shape, with very easy grades, and it is reported that next summer an automobile line will be in operation between the two places.

In the Gowganda district a large vein carrying some silver values has lately been discovered on the property of the Gow-

ganda Four, and a 1-inch vein of high-grade ore has been discovered on the Sweet claims at Hangingstone Lake.

An automobile stage, running five trips a day, has been started between Cobalt and the Kerr Lake district. This will be a great advantage to the residents of both places.

Recent development below the 200-foot level of the City of Cobalt has shown that the ore which pinched out came in again. An intermediate level has been run, and from 4 to 6 inches of

high-grade ore was found. Development in the banded slate below the 137-foot level has been very encouraging. Some of the richest ore in the mine has been taken from this formation.

The Cobalt Hydraulic Co. has connected the two portions of their 1,000-foot tunnel. The connection was made at a point 375 feet from the intake end. It now remains to cut out the two benches and to complete the second intake shaft. Work will also be started on the chamber near the outlet shaft from

which the air will be drawn off. The main pipe lines are rapidly being joined up, and when these are completed the different lines to the mains will be laid.

Mr. J. W. Shaw has been appointed manager of the Cochrane mine in place of Mr. Floyd Harman, who resigned a short time ago to take care of the Harman Mining & Development properties.

A special meeting of the Cobalt Development Co. has been called for Sept. 20th. in Toronto. The purpose of the meeting is to dispose of the remainder of the treasury stock at 25 cents per share. There is also a by-law to be brought before the meeting for the reduction of the number of directors from nine to five.

The shaft on the Gould Consolidated Mines at Cart Lake has now a depth of 125 feet, and will be continued to the 150-foot level. From this point cross-cuts will be driven east and west with the object of cutting the Nipissing vein and other leads under Cart Lake.

Progress is being made in sinking the shaft of the Union Pacific mine at Peterson Lake. When the 150-foot level is reached a cross-cut will be driven to cut the big vein which dipped from the shaft 60 feet below the surface. This company also owns claims adjoining the North Cobalt mine, and on one of these a shaft will be sunk in an effort to locate the big vein recently found by the Jacobs Exploration Co. A considerable sum of money has been voted by the directors for the purpose of developing some of their other properties.

#### WESTERN ONTARIO.

**Kenora Mining Division.**—The Prospectors and Mine Owners' Association held their monthly meeting on Tuesday, Sept. 7th. The entire meeting was given over to a discussion amongst the members of section 78, sub-section 1, of the Mining Act, some of the members being inclined to think that the working conditions enforced were of too stringent a nature. They finally instructed their secretary to write to similar

Vein 7 to 8 feet, 120 feet stripped, on claim located by G. Lariviere, Kenora.

associations in other districts asking an expression of opinion on this subject.

The Laurentian gold mine is now working double shifts, and the company is getting a good showing for its work.

The Paymaster mine at Gold Rock is erecting a new stamp mill, which will be in operation at the end of January, 1910.

The Detola mine is re-commencing operations, and has started in doing development work.

A good deal of attention is being paid to the West Hawk and High Lakes district, some thirty miles west of Kenora. Several prospecting parties from Winnipeg have been operating this summer in that district, but no important strikes are as yet reported.

Negotiations are now under way concerning the reopening of the Regina mine, owned by English capitalists. The pumping out of the mine and resumption of operations there at a not far distant date is confidently expected by those having a knowledge of the affairs of that company.

From the Sturgeon Lake district comes the report of a valuable find made by G. Lariviere, of Kenora. The vein is 7 to 8 feet, and has been stripped for a distance of 500 feet, and is showing splendid values.

In connection with these Sturgeon Lake properties it may be of interest to quote from an engineer's report made on behalf of a private company:—

"The formation of the country is Laurentian, Keewatin and Post-Keewatin. The great body of country rock is gneissic granite with intrusions of schists and slates. Porphyritic granite, quartz porphyry, mica syenite, etc., are common. The schists are chlorite, olivine, sericite, serpentine and mica, the first-named being the most common. Diabase, gabbro and diorite are important rocks of the district."

I might say that the reason so little prospecting has been done in previous years has been on account of the excessive cost of transportation, 100 miles from Ignace Station, until now, when we have the G. T. P. branch from Westfort, which takes us to the south end of the lake, on which there are several boats and good facilities for getting around. The greater number of the reported rich strikes of this year are upon prospects staked last year, and have shown up good values when sinking was started, and these values in nearly every instance increased with depth, and show free gold in remarkable quantities. Other properties have shown nuggets of native silver along with the gold. Copper occurs, and zinc blende is quite noticeable.

The district is in its infancy; the small lakes adjoining Sturgeon Lake have not been looked into at all. Nothing has been done back from the water, and scarcely any systematic work done.

#### QUEBEC.

**Sherbrooke.**—Mr. G. R. E. Kennedy has sent up from the Eastern Townships the best exhibit of the mineral wealth of that section of Quebec that has ever been shown at Ottawa. It is well known that that section of the Eastern Townships is the greatest shipper of asbestos in the world. In addition to asbestos, the Kennedys exhibit some beautiful samples of gold in quartz and nuggets, some from Nova Scotia and some from Southeastern Quebec, from which region the late Hon. J. H. Pope is credited with taking more gold than the public ever heard of. The exhibit also comprises chrome, mica, phosphate, marble, slate, talc, coal, copper, silver, etc.

John McDonald has transferred his copper property in Weedon to the people to whom it has been under option, the price being \$100,000, and the first payment was made Sept. 11.

On Tuesday, the 21st of September, Messrs. C. J. McCuaig, F. W. Bailie and S. W. Ewing, of Montreal, visited the properties of the Black Lake Consolidated Asbestos Co., and those of the Amalgamated.

The issue of \$1,000,000 of 8 per cent. gold bonds, with a bonus of 25 per cent. of preferred and 50 per cent. of common stock is announced by the Black Lake Consolidated. It is intended to erect immediately two large mills for the Union and the Bell mines, and later a third for the development of other portions of the company's large acreage.

Work on the 750-ton mill for the Union is begun, the concrete foundation for the rock bin and crusher house are nearly completed, and foundation for the drier house started.

Survey has been made for the tramway from the Southwark pits, about 4,000 feet is completed, rails purchased and delivered, and by the time the mill is ready it will be supplied with its full 750 tons per day.

A company has been organized by Messrs. E. A. Dyer, Dr. McDonald, John Harris, C. P. Willey, D. L. Smith, Wm. W. Smith, and C. N. R. Tarte, N.P., to open and operate a copper property two and one-half miles from the village of Sutton. Mr. Harris will have the management of the work.

H. D. Reihle, M.E., now retained by the Black Lake Consolidated Asbestos Co., has visited nearly all the known asbestos fields of the world. In 1897 he was in Dutch East Africa, Cape Colony, etc. In 1898-1900 he spent two years in Nordland, Norway. In 1902 he went to Asiatic Russia, Siberia, Altai and Northern Mongolia. Later he went to the Aosti Valley, Italy; then he examined some deposits in Georgia, U.S.A., returning to Canada, where he has erected an efficient and up-to-date plant in the East Broughton District.

Mr. C. E. Kennedy, of Beebe Junction, is opening an asbestos property in Northern Vermont that promises to make a mine. In spite of the man on the street, boundary lines of towns, counties, provinces or countries do not cut off mineral belts, as may be shown in Pontiac County, when the blanket licenses expire.

#### BRITISH COLUMBIA.

**Rossland.**—At the Le Roi mine, which is the centre of attention in this district just now, the working force has been steadily increased to a crew of about eighty men, and in addition to the three diamond drills a few machine drills have been put to work stoping ore from a new lode that has been recently opened up. In addition to the work going on in the lower levels the 600 and 700 ft. levels are also scenes of activity. It is expected that work will be energetically extended as opportunity and development permit from this time on, and all those interested here seem to be quite sanguine of good results ensuing.

At the Centre Star group and at the Le Roi 2, Limited, the regular weekly shipments were made, running the total shipments for the week ending Sept. 4th up to 4,370 tons, which is somewhat lower than the weekly shipments have been from this district lately.

Among the smaller properties about the camp things are not as lively as they were. At the Blue Bird there has been a cessation of work owing to the company having bought out the recent lessees and having now under consideration a plan of operation. The Evening Star is now not under lease, the last lessee having got into legal difficulties. But little work is going on at the Hattie Brown, although the management states that a plan of diamond drilling is being prepared. In the case of several meritorious small mines hereabouts, however, it is not lack of applications for leases that is causing the mines to lie idle, for there are a number of men who are willing to take hold, but the mining companies feel that it will take men with plenty of money to work the mines properly and systematically, and they are waiting until such time as men with money come along, when we may expect to see these mines on the working list once more. Taking the district throughout, things are looking well. There are some very good prospects in the hills about this camp that in the next four or five years will come into their own.

**The Boundary.**—There is so much going on in B. C. Copper and New Dominion affairs these times that one wonders where and how it is going to end. Last week the district received a visit from J. Lewisohn, a director of the B. C. Copper Co. and

heavy owner in the New Dominion. J. Parke Channing, consulting engineer of the New Dominion Copper Co., accompanied Mr. Lewisohn. Together with J. E. McAllister, manager of the B. C. Copper Co., they visited the Brooklyn and Rawhide (New Dominion) mines, the Mother Lode (B. C. Copper) at Greenwood, and the Sunset and Idaho (New Dominion). J. Seward, manager of the Dominion properties, was also of the party. It is quite natural, of course, that Mr. Lewisohn and Mr. Channing should look over the New Dominion properties at a time when dawn is just breaking over another (and we trust successful) period of operations for the Dominion mines. It is also businesslike of Mr. Lewisohn to look over the property of the B. C. Copper, in which he has invested a large sum of money and of which he is an important director. This more especially when the copper producers of the Boundary are about to enter an epoch-making period of activity.

The B. C. Copper Co. is making regular shipments of about 8,000 tons of ore per week to the Greenwood smelter, and the activity of the company is felt throughout this district. The company has a crew of men doing development work on the Sappho group, near Midway, which it has recently bonded. It has applied for a water right in the Similkameen water district, this water to be used on its claims in Wellington camp. A couple of Kamloops mining men have been here during the past week working on a proposition to bond one of the Kamloops groups of claims, on which there is a splendid showing of iron ore, to the B. C. Copper Co. The officials of the B. C. Copper Co. have announced that the concern will be in a position to pay a dividend when the surplus amounts to \$200,000 or over. The big "glory hole" workings of the Copper Co. are to be worked on a larger scale than ever from now on, so much so that the company is moving the homes of several miners that were near, fearing they might be damaged by the heavy blasting. This surface mining is really what counts in low mining costs in the Boundary, and is a big aid in the production of  $8\frac{1}{2}$  blister copper.

Work is soon to be started on the Canadian Pacific Railway spur into the Phoenix Amalgamated mine of the Con. M. & S. Co. of Canada. As soon as this spur is completed this concern intends to begin shipments to Trail smelter from this point, augmenting the shipments now being made from the Snowshoe. The Consolidated Company will also ship from the No. 7 mine in Central camp as soon as the new railway spur is built into that camp. It is suggested that it may be found necessary to build a concentrator to treat the ore from the No. 7 mine.

The general manager of the Granby Con. M. S. & P. Co., Mr. A. B. W. Hodges, is on a visit to the Queen Charlotte Islands and the Portland Canal mining districts. It is Mr. Hodges' opinion that if half of what he has heard of the copper deposits of the Queen Charlotte Islands is true, then another very valuable copper field is being opened up. Mr. Hodges was accompanied by R. P. Williams, of Rossland, who, with Mr. Hodges, is one of a syndicate that controls the Contact group of copper claims at Tasso Harbour.

The Granby Company will have finished enlarging its eighth and last furnace next month, and will then be in an excellent position to take advantage of the expected rise in the price of copper. The recent improvements at Grand Forks smelter of the Granby Co. have cost over \$250,000, the converter and blowing plant having been enlarged and several wooden buildings replaced with steel structures. It is considered that under the new working conditions the Granby will be enabled to place blister copper in New York at an average figure of  $8\frac{1}{2}$  per lb. It is now eight months since the Granby Company paid a dividend, and it is thought that there must be one about due. This concern has paid five million in dividends on an issued capitalization of thirteen million. Among the large shareholders who have benefitted some by these substantial dividends are

J. J. Hill, the First National Bank of New York, American Metal, Nichols Copper, H. I. Higginson, of New York, etc. The Granby smelter is now the largest smelter in the British Empire and the third largest on this continent, and consequently is in a position to rank as one of the lowest cost producers but for one or two things, one of which is the long haul to eastern refineries and markets.

**Nelson.**—The famous Big Ledge zinc property on the Arrow Lakes has been taken on option by W. J. Greenstreet, of the Guggenheim syndicate. The Big Ledge is a prodigious showing of "blackjack" bursting from the hills above the lakes, much of which averages 40 per cent. zinc. But little development has been necessary on the property aside from that done by Dame Nature in throwing up the huge mass of zinc ore. It is said the option price was in the neighborhood of \$400,000.

The Lucky Jim mine continues to make occasional shipments of zinc blende, carrying approximately 50 per cent. zinc. To

date about 1,200 tons have been shipped by the new management. There is a large quantity of concentrating ore in the mine, and it is planned to put up a mill to treat this product. Capitalists from the middle United States have bought the Sunset-Trade Dollar-Apex group near the Lucky Jim.

The buildings recently burned at the Silver King mine, Nelson, are to be rebuilt.

Good strikes of milling ore were made during the past week at the Mother Lode and Queen mines, Sheep Creek district.

A 20-oz. nugget, valued at \$359, was picked up on Granite Creek, near Barkerville, recently.

A group of Minneapolis capitalists has acquired 800 acres of coal land in the Nicola Valley, near Merritt. This land lies just north of the property of the Nicola Valley Coal & Coke Co., and west of that of the Diamond Vale Coal Co. The tract will be mined by a close corporation. Work along modern lines is to begin in the near future.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Glace Bay.**—President McDougall, of the U. M. W., was arrested and taken by special car to Montreal on a charge of criminal libel. Particulars are not known in Glace Bay.

### ONTARIO.

**Ottawa, Sept. 22.**—Dr. Eugene Haanel, Director of Mines, states that arrangements are being made for the establishment of the first electric smelting plant in Canada in connection with the Sault Ste. Marie iron and steel industries.

The Lake Superior Co. is arranging for the construction of a number of furnaces similar to those now in successful operation in Sweden.

A second electric smelting enterprise, involving the investment of several millions is also contemplated for the treatment of iron ores on the Ottawa River at Chat's Falls, where a splendid power site has been secured by a company headed by Mr. Louis Simpson, of Ottawa.

**Toronto.**—The particulars of the sale by tender of portions of the Gillies Limit were made public on September 15th. The total proceeds of the sale amounted to \$223,054.50. This includes \$113,111 for the Provincial Mine, which was purchased by Mr. F. M. Connell, of Haileybury. In addition to the mine, twenty parcels were offered for sale by tender. Only fifteen were sold. The area sold comprises 349 acres. The Provincial Mine property takes up 30 acres of this limit.

Including former sales, this brings up the total receipts of the Government to \$329,436.40; \$94,092.68 represents the total expenditure by the Government in mining and prospecting. The net proceeds are therefore \$234,543.72.

The successful tenders are as follows:—

- A5—Geo. F. Webb, Hamilton, \$7,709.
- A8—Ben Sommer, Montreal, \$7,447.30.
- A15—A. Pierce, Montreal, \$7,600.
- A20—T. C. Simpson, Westmount, \$12,250.
- A6—George E. Martel, Renfrew, \$15,300.
- A7—A. Rex Flinn, Pittsburg, Pa., \$4,506.
- A16—William Henry Legge, Toronto, \$3,502.
- A19—A. Rex Flinn, Pittsburg, Pa., \$6,511.
- A33—A. Rex Flinn, Pittsburg, Pa., \$2,706.
- A43—A. Rex Flinn, Pittsburg, Pa., \$2,706.
- A31—Frank E. Macdonald, Toronto, \$2,250.
- A44—A. H. Jackson, Montreal, \$2,655.
- A26—A. Pierce, Montreal, \$20,600.
- A38—Bannell Sawyer, Montreal, \$5,011.
- A39—A. Pierce, Montreal, \$9,200.

In addition to the purchase price the Government receives a 10 per cent. royalty on the gross proceeds of all sales of ore.

**Port Arthur.**—Two carloads of silver ore were shipped September 20th from Port Arthur on the steamer Easton. The ore came from the West End Silver Mountain mine, and is ticketed to Butte, Mont.

### ALBERTA.

**Taki.**—On September 13th, a Slav named Mike Nichylochuk was killed by a fall of rock at the Canada West Mine.

### BRITISH COLUMBIA.

**Nelson.**—On September 8th, Mr. Byron N. White, principal owner of the famous Slocan Star mine at Sandon, announced here that work would be resumed on a large scale at the property as soon as some details are closed in winding up the celebrated extra-lateral rights case with J. M. Harris, known as Star vs. White. It is expected that another month will see active work on this property resumed.

**Princeton.**—Wolframite has been discovered on the Marion group of claims near here.

**Kootenay.**—The B. C. Copper Company has secured options on seven of the best known groups of claims in the Kamloops camp. The groups bonded are the Bonanza group, consisting of the Comstock, Commoner, Ashton Fraction, Comet, and Cisco, all of which are held by Mr. H. Beckman on option from the original locators.

The Giantess group, two claims, Giant Copper and Giant Fraction, of which W. H. Fowler and Mr. Beckman are owners. Rising Sun group, consisting of Rising Sun, 1, 2, 3, 4, 5 and Rising Sun and Daylight Fractions, owned by E. B. Drummond and W. H. Fowler.

Kimberley group of eight claims, which includes the Stemwinder, Morning Star, Windsor Fraction, Keystone Fraction, Charlotte, Occidental, and Last Chance, all of which are owned by Mr. Beckman, who has recently spent a large sum in developing the property and has succeeded in showing an enormous mass of low grade ore.

Laura group of four claims owned by Drummond and Fowler, and which may also include the Grass Roots, of which Dr. Wade is the owner, and for which negotiations have been pending in association with the other members of the Laura group.

The deal also embraces the Maxim and Esperanza groups.

By the terms of the bond work will be commenced at an early date, and shipment of ore will follow as speedily as possible, and if the B.C. company is satisfied with the result

of their operations here, a smelter will assuredly follow, under the management of that corporation.

**Revelstoke.**—The Big Bend mica property is being developed with difficulty. The trails are in bad shape and will have to be improved before substantial work can be done.

**Victoria.**—The Pacific Metals Company has just been incorporated in Victoria with a capital of \$250,000. The object of the new mining company is to take over mining prospects and undeveloped mines and work them in order to bring them to a shipping or selling basis.

W. M. Brewer, who since 1902 has been ore-buyer for the Tye Copper Company of this city, which position he resigned president, and J. L. Parker, who was for some time manager of the Brown-Alaska Company's mines at Hadley, Alaska, and who was in charge of the North Star and Brooklyn and Steward mines in the Kootenay district, is manager for the new concern.

W. M. Brewer has been engaged in mining and ore buying for the last quarter of a century, and before coming to British Columbia in 1893 spent years in the mining districts in the Black Hills of South Dakota, Arizona, Colorado and other mining centres. For the past six years he has been engaged as ore-buyer for the Tye Copper Company.

It is expected the incorporation of the Pacific Metals Company will give an impetus to the development of mining in British Columbia, for prospectors and others who have promising prospects will find the company ready to take over the development. Mr. Brewer left on the steamer *Princess May* on behalf of the new company to look up some properties in the north.

### YUKON.

**Dawson City.**—The Yukon Gold Company, in which the Guggenheims are interested, employs 1,200 men on its various works, chiefly on Bonanza and Hunker, and have seven dredges and three electric lifts engaged in saving gold as well as hydraulic apparatus. It is expected that the company will pay a big dividend this fall, when operations will cease for the winter. By then the company will have dug 78 miles of ditches, obtaining the water from the head of the Twelve Mile.

The Northern Light and Power Company, which is developing coal deposits near Forty Mile, employs 200 men. This is the company formerly controlled by Dr. Grant and A. N. Fuller, and was taken over by an English company. Mr. Thurston is the manager.

## MINING NEWS OF THE WORLD.

### GREAT BRITAIN.

The owners of the Uranium and Radium mine at Grampound Road, near St. Austell, Cornwall, announce that their pitchblende lode has been reached at a depth of forty fathoms. The lode has forced its way through an extremely hard elvan course, every inch of which had to be blasted—the elvan course being a mixture of porphyry and granite. Some men of science doubted the existence of the pitchblende below the thirty fathom level; it is now proved to be present in good strength at a further depth of 72 feet. The British Metalliferous Mines, Ltd., believe that they will be able to supply larger orders for radium than that of 7½ grammes, value £30,000, they are now engaged upon for the Radium Institute. The company is erecting a concentrating plant, so that the pitchblende will go for radium treatment in a highly condensed form.

Preparations are being made for the erection of two steel furnaces at the works of W. Gilbertson & Co.

A lockout is threatened in the iron industry in Scotland. The Employers' and the Operatives' Executive Committee recently agreed to a reduction in wages of a farthing per hour, or a shilling per week on time rates and 2½ per cent. on piece rates, to take effect on the 9th instant. The day men have acquiesced, but the piece workers have struck. The employers have issued an ultimatum to the effect that if piece workers do not return to work on Monday there will be a general lockout of associated moulder throughout Scotland on Wednesday, the 15th September.

### EUROPE.

#### Spain.

A telegram from Huelva states that as the result of the strike of the workmen of the Mora mine, a British concern, the directors have declared a lockout which affects one thousand miners.

#### Russia.

So far as concerns production, the position of the Russian oil industry is a little more favourable than was the case a short time ago, and it is probable that an expansion will be shown in the output for the current year as the result of the increasing number of wells which are steadily coming into operation. An

analysis of the output of each individual source of supply shows, however, that the production per well is not improving. As regards prices, the current quotation at Baku is a little under 23 copecks per pood, which while higher than the corresponding quotation in 1907-8, is not so good as the figure ruling some six months ago. There does not seem to be much prospect of a recovery in prices just at present, though it is equally true that the market seems firm at the present level. Expenses have undoubtedly gone up very substantially of late, partly as a result of increased wages, while the much greater depths to which the wells have been sunk adds to the cost of raising the mineral. It is also a fact that a great deal of unproductive work has been carried out, a considerable number of the borings recently instituted having given no tangible results. As it costs at least £10,000 to sink a well, it is obviously a serious matter when such a heavy expenditure proves abortive.

#### Italy.

Salt is being experimented with by the Italian Department of Agriculture as a preventive of ankylostomiasis. The Formignano colliery was chosen as the place for the experiments. Here salt was strewn about the workings. Results so far are negative.

#### Roumania.

Eighteen petroleum testing holes at Moreni, the richest spot in the Prahova petroleum district, have been burnt out. The loss is estimated at about £40,000, of which half represents American capital. No loss of life is reported.

#### Austria.

The year 1908 was an eventful one in the Galician oil industry, being marked by greatly increased production and such unprecedentedly low prices that many of the producers were threatened with ruin. The Austrian Government finally came to the rescue with active assistance, which has helped towards putting the industry on a sound basis. By the end of 1907 the price of crude oil had fallen to 1s 3d per 100 kilograms. During the first three months of 1908 there was a slight rise in prices, but in April and May a number of new wells were struck, and the enormous overproduction which followed caused the greatest embarrassment to the industry, while the existing storage and railway transport arrangements proved totally inadequate.

In view of the critical condition of the industry, the Austrian Railway Minister visited the oil district and promised to introduce the use of oil instead of coal on the state railways in Galicia; he also arranged for improved transport facilities. A provincial association of oil producers, representing 80 per cent. of the total production, was formed, and this body made a contract with the state railways for the delivery of 220,000 metric tons of oil per annum. The railway authorities, however, found that it was not safe to use the oil in its crude state in railway locomotives, but that the benzine would have to be extracted first. The Producers' Association had not the capital to build the necessary works for this process or the new reservoirs required. Accordingly the Government undertook to build a factory extracting the benzine at Drohobycz, and to lease it to a cartel of the Austrian refineries which is being formed, and which will undertake to purify the oil for the use of the state railways. The state will pay the Producers' Association direct for the raw oil required at a price considerably higher than the present market price, and which has been fixed with reference to the cost of the coal that would have been required for the locomotives. The state will further build the reservoirs and lease them to the oil miners at a rate just sufficient to cover the interest and amortisation of the capital.

The Government has introduced a bill in the Reichsrath by which a concession will in future be necessary for carrying on the business of storing, handling, and refining raw oil in Austria, and the provincial authorities will be empowered to refuse this concession at their discretion.

In 1908 the amount of crude oil produced in Galicia was 1,734,235 metric tons, as compared with 1,175,974 tons in 1907 and 760,443 tons in 1906. 15,906 metric tons of mineral oils were imported into Austria-Hungary in 1908, as compared with 18,816 tons in 1907 and 27,399 tons in 1906; and 370,600 tons were exported in 1908, as compared with 217,258 and 195,885 tons respectively in 1907 and 1906. The export of mineral oils from the monarchy, chiefly in the shape of refined petroleum or benzine, has risen enormously during the last few years, having increased proportionately more rapidly than the total production, of which it now forms about the fifth part. Nearly two-thirds of the export are sent to Germany; then follow France, Switzerland, Turkey, Italy and the United Kingdom, the last-named country only taking 4,500 tons.

#### NEW ZEALAND.

The Consolidated Goldfields of New Zealand in 1908 distributed dividends to the amount of £12,119, as against £18,178 in 1907. Progress Mine paid no dividend; but the Wealth of Nations Mine gave a higher yield than usual, the working profit being £14,500, or 21s 5d per ton.

#### UNITED STATES.

The improvement in the spelter market is being reflected in the zinc-producing districts of Colorado. This is especially noticeable at Leadville.

The U. S. Assay Office, Butte, Montana, reported receipts of \$240,982 of gold during August. These receipts are unusually large.

The Goldfield Consolidated mill will probably be enlarged to a capacity of 1,000 tons per day. Its present capacity is 600 tons. Treatment costs are now less than \$2 per ton of ore.

The railroads are granting reduced rates to delegates to the American Mining Congress to be held at Goldfield.

It is estimated that the output of the Goldfield Consolidated, Goldfield, Nevada, for August stands at \$602,000. The ore tonnage was 22,160 tons. The estimated total cost of production was \$155,000, leaving a net profit of \$447,000.

The asbestos deposits near Casper, Wyoming, are being actively exploited. Two mills are to be erected in the near future.

#### MEXICO.

A number of mining companies have suffered directly and indirectly from the flood in the Monterey district. Although most of the mines are on high ground, their loss has been great through the destruction of transportation lines.

The tonnage of ore treated at the El Oro plant in August was 24,183 tons. Total yield was \$215,120, and net profits \$78,300.

#### SOUTH AFRICA.

Johannesburg.—A modified form of gelatine for blasting purposes has been produced at the Moddersfontein Explosives factory, and will, it is stated, enable two additional holes per shift to be drilled, requiring less labour for equivalent results, or enabling quicker and more economical development.

Mine Inspector Swinburne has recently made a highly valuable and instructive report upon the northern tin fields. The developments on the properties being worked by the Transvaal Consolidated, Lands, Rooiberg Development Company, and others practically assure a permanent industry.

The aggregate profits of the Witwatersrand mines for July amounted to £1,027,374. The month's development work gives a measurement equivalent to 15½ miles and marks another record.

The entire control of the Bantjes Consolidated is passing into the hands of Messrs. Eckstein & Co., their representative having been appointed chairman and the offices of the company transferred.

The new scheme for the amalgamation of the Nigel Deep with the Sub-Nigel is favourably criticised.

The Apex Mine and Benoni Consolidated have come to an agreement for the erection of a joint mill, capable of crushing 60,000 tons of ore per month, to be located on the former company's property. The developments on the Benoni property will ensure the supply of 20,000 tons per month to the first section of the mill as soon as erected.

The boring operations upon the Roberts-Randfontein property have resulted in striking a banket series at a depth of 1,950 feet.

In the Transvaal Government stope drill competition the Siskol drill has established a new record by accomplishing 132 feet in one shift.

Johannesburg.—At the annual meeting of the New Modderfontein Gold Mining Company, Mr. Sammel Evans, the acting chairman, stated that they anticipated that with the enlarged plant now working the costs for the current year would be substantially reduced. He forecasted a vigorous development policy, and stated that when the ore reserves had been sufficiently increased there would be such an enlargement of plant as would enable the present generation of shareholders to derive the maximum benefit from their extensive claim area. The recent development in their own property and in the Brakpan mine had proved the value of their deep-level ground. For the moment the rate of progress depended upon the supply of unskilled labour. It was impossible to forecast the condition of the South African labour market from month to month, but past experience justified them in concluding that in time they would get all the labour they wanted. Mr. Evans added that they were in the midst of an industrial revolution, the far-reaching effect of which on shareholders' dividends and on South African prosperity would only be fully appreciated in a few years' time. He pointed out that the largest companies crushed monthly per white employee an average of 95 tons, as against 85 for the smallest companies. Similarly the coloured labour of the large companies crushed 14 tons, as against 8 tons of the smallest companies. The number of coloured employees to one white employee was in the large companies 6.1 and in the small companies 10, thereby showing that the growth of the large concerns increased the proportion of Europeans employed, as compared with coloured labour, and improved the productivity of both classes of labour.

## COMPANY NOTES.

Following is the report of the Le Roi No. Two, Limited, for the Josie mine for the month of July, as issued by F. A. Labouchere, from the London office of the company.

Output.—Approximately 2,000 tons were shipped during July.

Development Work.—Development work was carried on in the Josie shaft, 400-foot level, 500-foot level, and intermediate level, between 500 and 700 (703 drift).

Josie Shaft.—The Josie shaft was sunk a distance of 97.5 feet during the month. Favourable ground was met with, which drilled and broke readily. We shall not make such good speed during August on account of the station cutting, which will be necessary at the 1,000-foot level. (The following cable has since been received: "Josie shaft, 1,000-foot level station, nearly completed.")

400-foot Level, 401 Drift.—This was driven eastward a distance of 41.1 feet until it met with the Josie dyke. As there is still ore in the hanging wall, this was slabbled off for about the same distance. The average assay from drift and slab work was .71 ozs. gold and 4.0 per cent. copper, but the ore, though very good, is too scattered to be given a definite width as yet. Twenty samples were taken.

402 Drift.—This was driven westward a distance of 34.9 feet, and met with a little scattered ore, which assayed .68 ozs. gold and 1.2 per cent. copper. Eight samples were taken.

500-foot Level, 501 Drift.—This drift was advanced a total distance of 3.75 feet during the month. Some stoping was also done. Nineteen samples of the scattered ore taken in drift and stope averaged .56 ozs. gold and 3.8 per cent. copper. Both here and in 401 stope the width of the ore body should show up more definitely during August.

703 Intermediate Drift.—This was advanced a distance of 79.5 feet and towards the end got poorer. The average assay was .87 ozs. gold and 1.2 per cent. copper over a width of 17 inches. Eighteen samples were taken.

Poorman Stope.—The ore from here is practically all second-class.

303 Stope, 300.—We shall probably discontinue drawing ore from here temporarily during August, since the ore now showing in the back of 32 stope is not so good. A pillar of ground will be left in for the present so that track will not be disturbed.

301 Stope.—More ore will be drawn from here during August than during July.

401 Stope.—This stope is showing up very well, and during the next five months should become an important ore producer.

423 Stope.—Three samples across the full width of the stope were taken here, and the average assay was .66 ozs. gold and 2.32 per cent. copper, over an average width of 2 feet. Lately the ore has begun to extend eastward, and in all this month's work has added about 53 feet to the stope.

32 Stope.—The ore in this stope is now getting a little poorer in the back the average of 40 samples taken during the month showing .68 ozs. gold and 2.1 per cent. copper over a width of 15 inches.

501 Stope.—This stope is referred to under the head of 501 drift. The ore here is gradually beginning to assume more definite shape.

702 Stope.—Good ore is being broken here, the average for the month being 1.86 ozs. gold and 5.3 per cent. copper over an average width of 1 foot 11 inches. Twenty samples were taken.

703 Stope.—The drift is being taken down here and stoping operations started. When this is timbered up, the drift will be pushed westward as long as it is in pay ore.

Announcement is made that the annual general meeting of the City of Cobalt Mining Company will be held on Friday, October 8th, at 3 p.m., in Cobalt. The report of the directors will be received and other business transacted.

The Buffalo Mines declared its regular quarterly dividend of 5 per cent., payable October 10th, to stockholders of record September 20th, and an extra dividend of 3 per cent., payable to stockholders of record November 5th.

### WORK ON THE LE ROI.

A despatch from British Columbia states that the managing director of the Le Roi, having returned to the mine, says that the directors having made the necessary financial arrangements, will enable him to undertake immediately the large and comprehensive scheme of exploration work approved during his stay in London. It is intended to sink the main shaft a few hundred feet further and to do a large amount of diamond drilling, so that the mine can be thoroughly prospected to a depth of about 1,000 feet below the present 1,650-foot level.

The directors of La Rose Mining Company on Sept. 20th. declared the regular quarterly dividend of 3 per cent., with 1 per cent. bonus.

The Herald has it on good authority that the next quarterly dividend will be on a higher basis.

While the Lawson property and other mines in the La Rose combination have been making wonderful showings, the development of the new properties has required the expenditure of a good deal of money, all of which has come out of the La Rose treasury. The La Rose, however, can at any time now increase its output materially.

At the meeting of Nipissing directors held on Sept. 20th. it was decided to raise the dividend from 20 per cent. to 30 per cent. per annum. The regular quarterly dividend was raised to 5 per cent, and, in addition, the bonus was made 2½ per cent.

By the time the Nipissing dividend is payable on October 20th next, the company claims that it will have a surplus of approximately \$1,300,000, of which \$800,000 will be in cash and the balance in ore in transit or at the smelter.

# STATISTICS AND RETURNS.

## COBALT ORE SHIPMENTS.

There were only six shippers among the Cobalt mines last week, with the bulk of the tonnage from the Nipissing and La Rose. Shipments for the week aggregated 871,750 lbs. of ore, or 435.87 tons.

Shipments of ore in pounds for week and year to date were:—

|                        | Week ending<br>Sept. 11. | Year.     |
|------------------------|--------------------------|-----------|
| Chambers-Ferland ..... |                          | 961,010   |
| City of Cobalt .....   |                          | 1,042,522 |
| Cobalt Central .....   | 41,360                   | 600,204   |
| Cobalt Lake .....      |                          | 79,960    |
| Coniagas .....         |                          | 1,216,895 |
| Crown Reserve .....    | 189,630                  | 4,433,079 |
| Drummond .....         |                          | 920,000   |
| Kerr Lake .....        |                          | 1,482,156 |
| King Edward .....      |                          | 180,740   |
| La Rose .....          | 273,700                  | 9,038,433 |
| McKinley .....         | 42,810                   | 1,431,106 |
| Nipissing .....        | 259,800                  | 9,560,043 |
| Nancy Helen .....      |                          | 83,400    |

Ore shipments to Sept. 18 from Jan. 1 are 42,401,022 pounds, or 21,200 tons.

Total shipments for week ending Sept. 18 are 924,420 pounds, or 462 tons.

The total shipments for 1908 were 25,463 tons, valued at \$10,000,000.

During the first seven months of 1909 the exports of anthracite coal from the United States amounted to 1,709,401 long tons, and of bituminous coal 4,915,914 long tons. Of these amounts Canada took 1,685,395 tons of anthracite, and 3,424,795 tons of bituminous. This amounts roughly to 77 per cent. of the total U. S. exports. In the same period Canada sent 543,198 tons of coal to the United States, and about 70,000 tons of coke, chiefly from the West.

## KASLO SILVER, LEAD AND ZINC ORES.

The ore shipments through Kaslo over the K. & S. for the month of August were the largest known for any single month for some years past. The output was 100 cars, compiling a total of 2,222 tons. Of this amount zinc ore formed the bulk with 1,710 tons and 482 tons of silver-lead. The latter was consigned to Trail, and the former to four zinc smelters in various parts of the United States. The largest shipper was the Whitewater with a total combined output of 1,010 of both classes of ores, zinc predominating, and the Lucky Jim a close second with 990 tons of zinc only. Although mining as a whole appears quiet, the output so far for 1909 is the largest for a number of years past, the total for the district to date being 13,597 tons of all kinds of ores, and from this is omitted the past month's output from the Bluebell, which would swell the August output at least 500 tons more. At the present rate of shipments the output for the year will easily touch or go over the 25,000 mark, which will establish a latter day record.

The following is the list of mines and their tonnage for August:—

| Silver-Lead.          |  |       |
|-----------------------|--|-------|
| Mine.                 |  | Tons. |
| Rambler .....         |  | 120   |
| Cork .....            |  | 82    |
| Whitewater .....      |  | 60    |
| Whitewater Deep ..... |  | 200   |
| Wellington .....      |  | 20    |
|                       |  | 482   |
| Zinc.                 |  |       |
| Lucky Jim .....       |  | 990   |
| Whitewater Deep ..... |  | 750   |
|                       |  | 1,740 |

Total output to date of silver-lead and zinc ores, 12,597 tons.

Nelson, Sept. 11.—Some 80 men are now at work in the Le Roi mine at Rossland, and it is expected that shipments will be recommenced shortly. The output of the district for the past week has been about the average for the year so far. Appended are the details:—

## ORE SHIPMENTS.

## TORONTO MARKETS.

## Metals.

Sept. 24.—(Quotations from Canada Metal Co., Toronto.)  
 Spelter, 5¼ to 6 cents per lb.  
 Lead, 3.50 to 3.60 cents per lb.  
 Antimony, 8 to 9 cents per lb.  
 Tin, 32 cents per lb.  
 Copper, casting, 13¾ cents per lb.  
 Electrolytic, 13.75 cents per lb.

Ingot brass, 9 to 12 cents per lb.

Sept. 24.—Pig iron.—(Quotations from Drummond, McCall Co.)

Summerlee, No. 1, \$22.50 (f.o.b. Toronto).

Summerlee, No. 2, \$22.00 (f.o.b. Toronto).

Midland, No. 1, \$21.00 (f.o.b. Toronto).

Coal—Anthracite, \$5.50 to \$6.75.

Bituminous, \$3.50 to \$4.50 for 1¼-inch lump.

## Coke.

Connellsville coke (f.o.b. ovens):—

Furnace coke, prompt, \$2.50 to \$2.75 per ton.

Foundry coke, prompt, \$2.75 per ton.

Tin (Straits), 30.35 cents.

Copper, prime Lake, 13.00 cents.

Electrolytic copper, 12.85 to 12.95 cents.

Copper wire, 14.50 cents.

Lead, 4.37½ to 4.40 cents.

Spelter, 5.75 to 5.80 cents.

Sheet zinc, 8.00 cents.

Antimony, Cookson's, 8.50 cents.

Aluminium, 23.00 to 24.00 cents.

Nickel, 40.00 to 47.00 cents.

Platinum, \$25.50 to \$29.25 per oz.

Bismuth, \$1.75 per lb.

Quicksilver, \$43.50 to \$44.00 per 75-lb. flask.

## MARKET NOTES.

Ferromanganese is a desired commodity. Deliveries for next year are going up in price. Pittsburg prices stand at about \$43.45 per ton f.o.b. Pittsburg, for prompt, and \$45.45 for future delivery. During the fiscal year 1907, 94,543 tons of ferromanganese were imported into the United States. The corresponding figure for 1908 was 58,101 tons, and for 1909, 64,107 tons.

Silver.—Messrs. Pixley and Abell report on September 10th a moderate inquiry for silver from the Indian bazaars on September 9th. The market closed steady. Fluctuations of the market in the near future will likely be small.

The amount of silver consigned to Bombay by this week's (Sept. 10th) steamer is about £150,000. A shipment of £22,500 was made from San Francisco to the Far East.

M. Cochery, the French Minister of Finance, has appointed a committee to study the advisability of introducing aluminium fractional coinage to take the place of copper and nickel coins. The movement was brought about by the fact that in the last 55 years copper coins to the nominal value of £900,000 have been lost out of a total coinage of £2,900,000. Aluminium has many advantages. It is light, does not tarnish, and cannot cause poisoning.

# Mining Companies

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing, and distributing Annual Statements, Special Reports, Descriptive Pamphlets, Prospectuses, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction. We are making a specialty of engraving and printing bonds, stock certificates, professional and business stationery, business cards and all such work. Orders from mining districts will receive prompt attention.

We shall be glad to furnish estimates to enquirers.

## Canadian Mining Journal

Confederation Life Building - - - Toronto, Ont.

Now Ready

# Richard's Ore Dressing

Volumes III and IV

Per Volume \$5.00 [21s] Net Postpaid

The Set, 4 Volumes, \$20.00 [£4 4s] Net Postpaid

NOTICE—The index for all four volumes will be issued separately and supplied free at an early date to all purchasers of Volumes III and IV.

It required two large volumes to cover the new machinery, processes, discoveries and data in ore dressing. These volumes supplement but do NOT SUPPLANT I and II.

In general arrangement Volumes III and IV are similar to Volumes I and II. The Chapters are each intended to supplement the subject-matter of the corresponding chapters in the earlier volumes, describing new machines, new processes, and giving new data. The greatest care has been exercised in avoiding repetition.

Since the issue of the earlier volumes, many important discoveries have been made and radical departures introduced in established processes. Volume III, for example, has complete discussions of fine grinders, particularly the tube mill and grinding pans, rectilinear tables of the Wilfley type, the questions of magnetic separation, electrostatic separation, the flotation processes, and other subjects of like importance not covered in the earlier volume.

When Volume I was issued, the tube mill, which has almost revolutionized gold and silver milling practice, was

hardly touched upon. The Wilfley table was just finding its place among mills, and a number of other tables of the same type have been developed since.

Volume IV describes in detail some 94 complete mills, showing the most approved modern and successful methods of applying ore-dressing principles in use to-day throughout the mining districts of the world. Comparisons are made with earlier descriptions to show modifications and improvements, and to point out errors in older plants.

Throughout both volumes, much space and great care have been devoted to the general subjects of costs of operation, speed, capacity, water power, life of machines, etc. Power and water plants are described in connection with nearly every mill.

Complete Bibliographies are added. The Index for the entire four volumes has been remade and will be bound separately. It will be furnished without charge to purchasers of Volumes III and IV.

Book Dept. Canadian Mining Journal - Toronto

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## THE ROAD TO GOWGANDA

BY THE  
CANADIAN NORTHERN ONTARIO ROUTE

is thirty miles shorter than any other. Beginning February 2nd, through sleepers leave Toronto, 5 p.m. arriving Sellwood (Moose Mountain Iron Mines) next morning. (Breakfast served on train.) From Sellwood to Gowganda is one day's sleigh ride over the company's own road; comfortable road houses are stationed at easy distances and a fast-freight and passenger service has been inaugurated with all points in Canada. Inquiries invited:—

Wm. Phillips, General Freight & Passenger Agent,  
C. Price Green, Passenger Agent,

King and Toronto Streets,  
Toronto

## Newton & Treloar

Commercial & General  
**PRINTERS**

14 Johnson Street, Toronto

NOW READY

# Mining Law of Canada

BY

**ALFRED B. MORINE, K. C.**

(Of the Bar of Ontario, Nova Scotia and Newfoundland)

The following table of contents conveys a fair idea of the scope of the work :

|                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                   |                                                                                                             |

**CANADA.—DEPARTMENT OF MINES.**

# Geological Survey

## PUBLICATIONS

The Geological Survey has published maps and reports dealing with a large part of Canada and with many local areas and special subjects

### MARITIME PROVINCES

The whole of Cape Breton and a large portion of the coal and gold fields of Nova Scotia have been reported upon and mapped on a scale of 1 mile to 1 inch. The remaining portions of the province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter provinces, mapped on a scale of 4 miles to 1 inch.

### QUEBEC

Quebec, south of the St. Lawrence, has been reported upon and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the province north of the St. Lawrence are also available.

### ONTARIO

A large part of the province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

### THE PRAIRIE PROVINCES

Geological maps and reports have been issued covering the greater part of the provinces of Manitoba, Saskatchewan and Alberta.

### BRITISH COLUMBIA

The southern portions of British Columbia, as well as other parts of the province, have been reported upon and mapped.

### YUKON

Many of the important areas in the Yukon have been reported upon and mapped.

### THE NORTH-WEST TERRITORIES

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to *THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

### **THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED :**

#### **NOVA SCOTIA**

1019 City of Halifax Sheet.

1025. Waverley Sheet.

The above two sheets belong to the regular series of Nova Scotia map sheets on a scale of one mile to one inch. The first includes Halifax City and Harbour, the second the Waverley Gold District.

#### **ONTARIO**

1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

#### **BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shews the geology and location of veins.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch, by W. H. Boyd.

NOTE.—Maps recently published may be had on linen cloth for use in the field at the price of 10c. per copy.

#### **REPORTS**

1072. Summary Report of the Operations of the Geological Survey for year 1908.

The Geological Survey, under certain limitations, will give information and advice upon subjects relating to general and economic geology. Mineral specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to *THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

*When answering Advertisements please mention THE CANADIAN MINING JOURNAL.*

University of Toronto**FACULTY OF APPLIED SCIENCE  
AND ENGINEERING**

## Courses in

1. Civil Engineering.
2. Mining Engineering.
3. Mechanical and Electrical Engineering.
4. Architecture.
5. Analytical and Applied Chemistry.
6. Chemical Engineering.

Diploma granted at the end of three year  
B. A. Sc. at the end of one additional year.

## Professional Degrees:

Civil Engineer (C. E.)  
Mining Engineer (M. E.)  
Mechanical Engineer (M. E.)  
Electrical Engineer (E. E.)  
Chemical Engineer (C.E.)

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries  
Quebec.**

## Province of Nova Scotia

**Leases for Mines of Gold, Silver  
Coal, Iron, Copper, Lead, Tin

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver, \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals, or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,000, the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

### The Great Double Track Route Through Canada.

Fast passenger service from the Atlantic Ocean to the head of the Great Lakes. The line taps all the principal commercial centres in Canada and reaches the important points in the States of Maine, New Hampshire and Vermont, the principal towns and cities in the Provinces of Quebec and Ontario, and many important places in the States of Michigan, Indiana and Illinois.

## The "International Limited" (Canada's Railway Greyhound)

### The Finest and Fastest Train in the Dominion

Runs every day in the year leaving Montreal at 9.00 o'clock in the morning for Toronto, Hamilton, Niagara Falls, Buffalo, Detroit, Chicago and intermediate points.

Write for copy of "Trains 3 and 4" descriptive of the route from Chicago to the sea, to J. Quinlan, Bonaventure Station, Montreal, or to J. D. McDonald, Union Station, Toronto.

**THOS. FIRTH & SONS, LIMITED, SHEFFIELD, ENGLAND**

"Speedicut" High Speed Steel, Tool Steel, Axe Steel, Saw Steel, Files, etc. A large stock carried in our warehouse

**BARROW HAEMATITE STEEL CO., BARROW-IN-FURNESS, ENGLAND**

Quotations for Tee Rails, Fish Plates, etc., promptly furnished. Catalogues sent on application.

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

**General Passenger Department, Intercolonial Railway**  
**MONCTON, N.B.**

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

## Canadian Westinghouse Co., Limited

General Office and Works, HAMILTON, ONTARIO.

Traders Bank Bldg.,  
TORONTO.  
439 Pender Street,  
VANCOUVER.

Address nearest office:  
HAMILTON.  
922-923 Union Bank Bldg.,  
WINNIPEG.

252 St. James Street,  
MONTREAL.  
158 Granville Street,  
HALIFAX.

# HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal  
MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and  
Sporting Powder, etc.  
Safety Fuse, Electrical Fuses, Batteries, and other  
Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

A letter or telegram addressed to the head office or any of the following agencies will receive prompt attention.

COBALT TORONTO KENORA WINNIPEG, MAN.  
VICTORIA, B.C. VANCOUVER, B.C. CALGARY. ALTA. NELSON, B.C.

Three Post Magneto Electric Blasting Machine

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

## The "Little Hardy" Coal Cutter

Holes at Floor Level or Roof Level or in any intermediate position in Coal or Dirt Band, &c.

Equally suitable for Holing and Shearing.

The Lightest Coal Cutter in the Market.

Nearly 700 Machines at work. 93 in use by one Canadian Company.

## The Hardy Simplex Hammer Drill

Weight 22 lbs. Bores 6 ft. Deep.

Automatically Rotates the Drill Steel and lows out the Cuttings  
FOR SINKING, &c.

**SOLE MAKERS**

**The Hardy Patent Pick Co., Limited**  
SHEFFIELD, ENGLAND

Stocks of these machines kept by Messrs. A. C. Thompson  
Co., Limited, North Sydney, Nova Scotia, Canada.

## YOU CAN'T LOSE

By making a trial of the "CLEVELAND" Stope Drill—if you are not convinced that it is the best Stope Drill made—send it back to us.

## THE "CLEVELAND" STOPE DRILL

has made a reputation for itself from the Eastern to the Western Coast of Canada and is being used to-day in practically every mining section—Nova Scotia, Cobalt, British Columbia. There are more "Clevelands" in use in Canada than all other makes combined.

## IF YOU TRY

an equipment, we feel sure you will buy it, so let us ship you one for inspection and trial, with the understanding that it can be returned if not satisfactory.

Bulletin 40-A Mailed on Request.

**THE CANADIAN CLEVELAND DRILL CO., LTD.**

P. O. BOX 522, COBALT, ONT.

# JEFFREY

## Electric Locomotives

Comparative cost of maintenance of Jeffrey locomotives with other locomotives has been made by a number of the largest users of electric locomotives in the United States resulting in the establishment of Jeffrey locomotives as standard equipment. Write for Bulletin X15.

WE BUILD

## Underwood

A contest for the typewriting championship of the world was held in New York on September, 30th.

It was won by Miss Rose L. Fritz, the famous Underwood operator, who wrote 102 words a minute for one hour.

The Underwood has won the world's championship in thirteen successive contests. It has won every other contest of importance in recent years.

Contests subject a machine to the severest strain. The logical deduction is that the Underwood is a good typewriter.

## Amatite ROOFING

All you need  
is a  
- hammer -  
you'll never  
need a  
paint brush

lay it right over the old roofing. It will cost you less than the continued maintenance of the old roof.

The point to remember is that you will never need a paint brush if you buy Amatite roofing. All you need is a hammer, because we supply free nails and liquid cement to finish the job.

Send for free sample of Amatite and you will at once see why it never needs to be painted and why it is more durable and lasting than any other.

Write to-day to nearest office.

When you lay Amatite on the roof you're through with it. You don't have to paint it every year or two to keep it from leaking. It has a real mineral surface which does not need painting.

Next time you are due to paint your old roofing, just let it go till the roof is worn out and then get Amatite and

### HUGH FLETCHER.

It is with deep sorrow that we record the death of Hugh Fletcher. To the mining fraternity of Nova Scotia his death is a particularly hard blow. There, in our easternmost province, he was known, respected, and by many persons of all classes regarded with affection. At Ottawa the loss will be felt no less severely.

Hugh Fletcher's father, himself a mining engineer of high character, brought him to this country over fifty years ago. Young Fletcher received his early education in Ontario. Later he became a gold medallist at Toronto University. In 1872 he joined the staff of the Geological Survey of Canada. Since that time Fletcher devoted practically all of his field work to examining the coal fields of Nova Scotia. Upon his carefully wrought-out conclusions has been based much of the commercial development of Nova Scotian coal. While it is not practicable now to sum up his work, it is entirely within bounds to assert that Hugh Fletcher left a strong impress upon the history of Maritime coal mining.

It is characteristic of Fletcher that no inducement could tempt him from his chosen path of duty. In season and out of season he stuck to his task. While his labours, translated into terms of money, put many thousands of dollars to the credit of the coal industry, he himself was satisfied with the meagre stipend that Ottawa bestows on genius and mediocrity alike.

Totally unexpected as Fletcher's death was, there is something peculiarly fitting in the circumstances in which it occurred. He died in harness, in the country where he had laboured, and he was buried in the quiet country churchyard of Springfield, Nova Scotia, where lies the body of his wife. Fletcher's grave is shadowed by a mountain and near it runs a river. The surroundings are calmly beautiful.

The Mining Society of Nova Scotia, the Provincial Government, and the coal operators joined to honour his memory. Representatives of all attended his funeral. From Ottawa came messages of sympathy. But it is pleasant to remember that appreciation and recognition came before Death called. We remember not one but several occasions on which the Mining Society of Nova Scotia, in annual meeting assembled, expressed its high sense of Fletcher's worth. On these occasions nothing was more noticeable than the sensitive modesty of the man. The shy, whimsical, altogether manly way in which he would receive the most flattering encomiums was one of his chief charms.

It is proposed, and the proposal meets with our warmest approval, to erect a tablet or monument to the memory of Fletcher in the new Technical College at Halifax. This is well. But a better and more effective memorial would be the founding of a "Hugh Fletcher" chair in geology.

Linked with Fletcher's name in working out the

geological problems of Nova Scotia is the name of Fletcher's friend, E. R. Faribault, another faithful officer of the Survey. Although their spheres were quite distinct, both were animated by the same high purposes, and the names of both have been coupled in many a toast at the dinners of the Mining Society of Nova Scotia. And those names have stood and will continue to stand, as symbols of professional integrity and zeal, and lofty impersonal ambition for the work's sake.

### THE DEPARTMENT OF TRADE AND COMMERCE.

A special note has just been sent by the Dominion Department of Trade and Commerce to every publication in Canada. Enclosed with the note is a circular form from the Export Bureau of the Department. This form is being distributed to the members of all Boards of Trade, Chambers of Commerce, and Trade Associations throughout the Dominion. When filled in and returned, the forms will give the Department the material for compiling an Index of Canadian Manufacturers, Exporters, and Producers. When this exhaustive compilation is complete it will be printed and sent to all the Canadian Trade Commissioners in the various parts of the world.

This is the first effort of the kind ever made in Canada. That it will facilitate trade is certain. But its value will depend upon its completeness. Printed forms are usually thrown into the waste-basket. Most of them deserve this fate. The Department's form, however, can be made a thing of value. The Department gives its service gratuitously. The amount of labour involved, so far as the Department is concerned, is immense. The one object of this labour is to open new channels of commerce for Canada. We believe that the proposed Index will be of large use to mine operators. For many Canadian minerals and mineral products there could be built up a considerable European demand. A ready source of reference, placed where the enquirer can see it with least trouble, will form an effective connecting link between the Canadian mineral producer and the foreign consumer. And no one can deny that this is badly needed.

### THE NANAIMO DISASTER.

Thirty lives were lost in an explosion in No. 2 Mine Extension of the Wellington Colliery Nanaimo, B.C., on October 5.

No authentic details have been received before going to press. It is, therefore, superfluous to indulge in speculation as to the cause of the explosion.

But it is entirely appropriate to point out that upon the Government of British Columbia devolves the duty of making immediate and complete investigation of the circumstances leading up to the disaster. More than this, it is imperative that the present working conditions of the collieries of the province be fully ascertained.

We have grave doubts as to the efficiency (in numerical strength if in nothing else) of the present B. inspectorate. The duty of investigating such sad occurrences as this calls for ability of a high order. More experience of a very special kind is required.

Modern research, both in America and Europe, has thrown much light upon the nature and causes of colliery explosions. To a large extent they are preventable. The government of British Columbia should lose not a moment in taking whatever steps are recognized as necessary by the most enlightened authorities of the day. The snuffing out of thirty lives is a sufficient poignant object lesson.

### FAIRY GOLD.

A certain son of Belial is loose in the Lake of the Woods. Here, at Kenora, he has built him a place wherein, by occult means, he renders from the ore gold not extractable by fire-assay nor by any other device known to man.

Indeed, if you wish to get some idea of what this gentleman at Kenora can do to a gold ore, all that is necessary is to multiply by three or four the results obtained by an ordinary or garden variety of assays. And so convincing is the manner of this Kenora process that several mature citizens have not abstained from chipping in with him.

We are not unfamiliar with the kind of process that is being exploited in Kenora. There are many such varieties, based upon the alleged existence of "queen gold," "latent" gold, etc., etc., and etc. But the real object of search in all these processes is another allotropic form of the metal named "fools'" gold.

Surely, surely, Kenora should have cut its wisdom teeth by this time!

### ANOTHER CLAIMANT FOR THE POLE.

A third disputant has been added to the North Pole row. Our readers will notice in the letter of our Glenora Bay correspondent a substantial claim put forward for the Dominion Coal Company. Peary's steamer, the "Roosevelt," was bunkered with Dominion coal, and our correspondent appears to fancy that this amounts to a lien upon the Pole. Is it possible that the fee was not paid for? Internal evidence, chiefly the fact that President Taft refused to accept the Pole as a gift, seems to strengthen this supposition. It will not surprise us if Mr. James Ross makes the next move in the game. In fact, if Mr. Ross has a valid excuse for attaching the Pole, we shall rise up and call him blessed. Obviously this is the only means of squealing Cook and Peary.

### GOOD WORK.

The Temiscaming Mine Managers' Association, Cobalt, has taken upon its shoulders the load of caring for the sick in that fever-stricken town. With many

yellous crassness, the town authorities refused to see the gravity of the situation. Officially nothing was done until the association literally forced itself into control of the situation.

It is fortunate for Cobalt that the Mine Managers' Association is composed of live, fearless, and humane men. To the enlightenment of its officers and members is to be credited the effective measures that have at last been taken to fight the typhoid plague.

The Canadian Mining Journal desires to give expression to its warm appreciation of the spirit that animates the Temiscaming Mine Managers' Association. Long may it flourish.

---

### EDITORIAL NOTES.

We are glad to notice evidence of renewed interest in the silver mines of the Thunder Bay district. It is probable that the chief obstruction to progress is the fact that much of the mining land is held under old Crown grants and cannot be alienated except by special act of legislature. However, since the district has been moribund for so long, outside help should be eagerly welcomed.

---

The lead refinery of the Consolidated Mining and Smelting Company, Trail, B.C., was merely an experimental plant in 1902. It had then a capacity of six and one-half tons per day, and ten men were employed. To-day its capacity is 70 tons per day, or about 2,000 tons per month. Its employees number fifty. Its equipment is not only modern, but is, perhaps, the most efficient in existence.

The currency of the Chinese Empire is almost hopelessly complicated. Long ago the silver tael was the standard of weight. To-day the actual weight standard is the copper "cash." The value of silver currency is based upon the "cash," but in no well-defined relationship. The silver "dollars" of the different provinces and of foreign countries and the enormous number of 5-cent and 10-cent pieces in circulation further confound matters. The provincial mints have turned out such quantities of these coins that they are now subject to discounts ranging from 3 per cent. to 10 per cent. The Chinese market for silver is at present steady and strong.

---

Unless we are sadly mistaken those in control of the Waldman mining claims on the Gillies Limit are preparing for a stock-selling campaign. For some time readers of Toronto and Montreal newspapers have been kept artfully on the qui vive. The psychological moment for offering shares to the public may arrive at any moment. It will then be well for the public to remember that, so far as investment is concerned, the Waldman is an unknown quantity.

---

An enterprising firm of brokers and bankers, F. B. McCurdy and Co., Halifax, N.S., is distributing an unusually useful little handbook entitled "Nova Scotia Financial Register, 1909." The Register contains a list of incorporated towns and municipalities along with their financial statements, and a classified schedule of incorporated companies. In this latter list we notice many mining companies. We make special mention of this "Register," because of the excellent manner in which it is compiled. It will serve as a model for similar work in other provinces.

---

## THE PLANT AND EQUIPMENT OF THE COBALT HYDRAULIC COMPANY.

### A Description of Their Taylor Air Compressor Plant at Ragged Chutes, on the Montreal River.

Apart from the erection of concentration plants, or, more correctly, conjointly with this development, the harnessing of the superb water-powers in the country surrounding Cobalt is the most significant feature in the industrial growth of silver mining in Northern Ontario.

The hydraulic air compressing plant of the Cobalt Hydraulic Company is one of several large concerns that will supply the mines of Cobalt and its environs with power at about one-third the present cost. The company's plant is situated at Ragged Chutes, eight miles south-west of Cobalt. Roughly, 10,000 horsepower be developed at Ragged Chutes at low water. The

Cobalt Hydraulic Company's plant is calculated to furnish 5,500 h.p., more than enough to supply the present available power market in Cobalt mines.

The plant is practically automatic, as the air compression is effected on the Taylor system by the direct action of falling water.

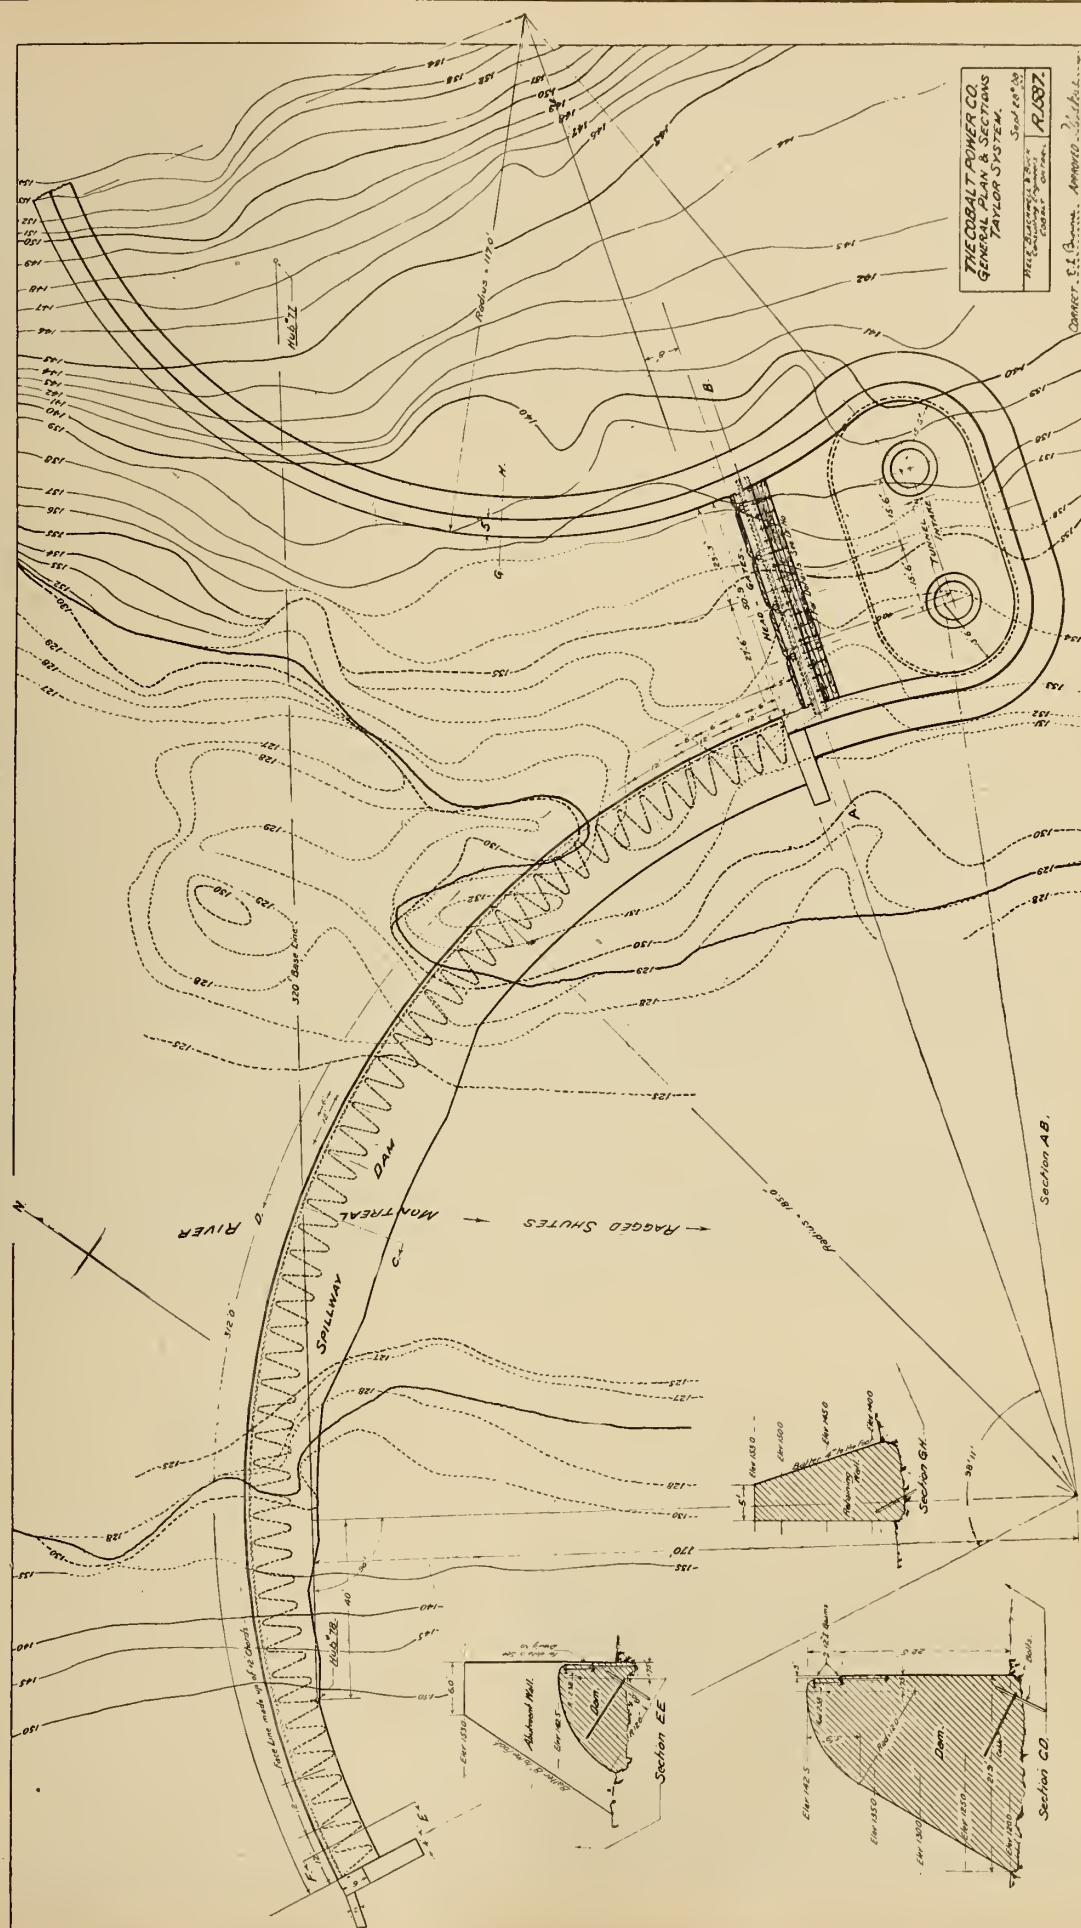

Although the principle involved in the Ragged Chutes installation has been utilized for many centuries, it is only with the last few years that successful commercial applications of this principle have been made on a large scale. Modern plants, such as that built in 1900 at Ainsworth, B.C., by the Kootenay Air Supply Co., are all based upon the system elaborated

are reduced to a diameter of 9 feet immediately below the spider. Forty feet from the bottom of the shaft the diameter is increased to  $11\frac{1}{2}$  feet. This increase of diameter tends to lessen the compression and to liberate the air. Two steel-sheathed concrete cones receive the full impact of the water and direct it into a horizontal tunnel 1,021 feet long, following the flow of the river. The tunnel is 22 feet wide and near the bottom of the tail-shaft 42 feet high. At the bottom of the intake it is about half this height. (See Fig. 1, Sections AA and BB.)

Diverted into this commodious channel, the water loses momentum, and the air is freed rapidly. It is now under a compression of 125 lb. per cubic foot. At this pressure it loses all but a negligible amount of its

by Charles H. Taylor, of Montreal, who, in 1896, devised the equipment of the Dominion Cotton Mills, at Sagoy, Quebec.

Mr. Taylor's modification simply consisted in an effective method of breaking up the water and impregnating it with finely divided particles of air.

The Ragged Chutes plant is probably the largest artificial compressor in the world. A 660-foot dam stretches across the Montreal River at Ragged Chutes. Here, at the intake gates, are two 16-foot intake pipes, each of which is fitted 66 air-intake pipes 14 inches in diameter, placed some feet above the level at which the water enters the larger pipes, and set in a steel siding around these. The spider's conical extension partly occupies the mouth of the large intake pipe so as to leave an annular space for the water to enter. The falling water draws air in through the small pipes, and thus in its descent of 351 feet becomes a mixture of water and compressed air. The water intake pipes

Part of General View.

moisture. Near the bottom of the tail-shaft (see elevation, Fig. 1) a 24-inch steel pipe enters the tunnel and conduits the air to the surface, and into the twenty-inch main that serves the mines. The water races past, and, as the tunnel is smaller at this point, forms an air-tight seal that leaves the compressed air no other

in the system. Elaborate care has been taken with gaskets and with joints to insure absolute air-tightness. Every joint is supported by two rails which, in turn, are bolted to wooden ties buried beyond danger of damage by fire or weather.

Two 12-inch service pipes now connect the 20-inch

vent. The water itself enters the tail-shaft, and, since there is a drop of 48 feet between the intake and the mouth of the tail-shaft, it overflows into the river.

The 20-inch main is constructed of steel pipes brought from Germany. It is made up of 40-foot

main with La Rose. One of these loops through the Nipissing, Trethewey, Coniagas, Cobalt Central, Buffalo, Townsite, McKinley-Darragh, and back to the Nipissing. The other is carried over La Rose, Nipissing, O'Brien, Colonial, Victoria, and Nova Scotia.

Cobalt Hydraulic Power Co.—Spillway of Dam, Ragged Chutes.

lengths of seamless flanged steel, each length weighing 3,000 lb.

To guard against the evil effects of unequal temperatures, the pipe-line is anchored to heavy concrete piers on solid rock foundation at half-mile intervals. Halfway between each pier an expansion point is fitted

third line will run north of Giroux Lake through the University, Foster, and other properties in that region. A fourth line is projected through in the direction of the Cobalt Merger.

The middle of November is set as the time when it will be ready for delivery into Cobalt. Twenty-five

cents per thousand cubic feet at 100 lb. pressure is the rate to be charged. This, of course, is a radical reduction of existing costs. The pressure will be uniform, the air dry, and the service not subject to interruptions.

Among other contracts, the following eight mines

have signed for approximately one-third of the total capacity of the plant: La Rose, 350 cu. ft.; Nipissing, 250 cu. ft.; Kerr Lake, 200 cu. ft.; Coniagas, 150 cu. ft.; King Edward, 175 cu. ft.; Buffalo, 150 cu. ft.; Chambers-Ferland, 150 cu. ft.; and Colonial, 50 cu. ft.

### EVOLUTION OF DREDGES.

At the meeting of the Oroville Dredging Company, recently held in London, the chairman referred to an important development in the size of dredges likely to reduce working costs from 7 to 3 cents per cubic yard. He said they are now using 7 ft. buckets in their largest type, whilst neighbours in California are using 14 ft. bucket dredges. He had seen the accounts of the company operating the 14 ft. bucket dredges handling

250,000 cubic yards a month at a cost of under 3 cents per cubic yard. "Now, it does not require a great deal of intelligence," Mr. Baker continued, "to realize that if you have a property with a life of ten years, as we have in the Oroville alone, where operating costs are nearly 7 cents per cubic yard, if we can put in two 14 ft. bucket dredges at a cost of £80,000 we can make an economy. These dredges will each treat 250,000 cubic yards a month, or six million cubic yards in a year. With

Cobalt Hydraulic Power Company.  
Looking Down Montreal River from point near Intake—Head-house of Intake in Distance.

these we could repay the cost of the two dredges in 18 months out of economies we can make in operating at a cost of under 3 cents, as against a cost of nearly 7 cents to-day." The large bucket dredges have been in actual operation for a little over a year, and the properties on which they are located are being examined by an engineer of high standing, and if he confirms the statements as to capacity and costs it is the intention of the Oroville Dredging Company to scrap most of its old dredges and put in the big modern dredges. In dealing with six million cubic yards a saving of 4 cents is equal to about £50,000 annually."

The above statement is really of world-wide importance, and will do to the dredging industry what the

tube mill has done to the quartz mining industry. It will reduce costs of dredging to such an enormous extent as to permit of immense areas of formerly unpayable ground being profitably worked and give a great impetus to dredge construction, already an important industry. The advertisement of no fewer than three of the foremost firms of dredge builders in the world appear in the advertising columns of this issue, and the writer has marked the extraordinary progress which has been made in the latest designs of dredge construction. These modern dredges have outdistanced even the latest New Zealand designs, which have until recently been considered the most advanced in this class of work.—Financial Times, London.

## Riviere Du Loup Goldfields—Townships of Jersey and Liniere, Beauce County, Quebec.

Notes and Extracts from a Special Report by Dr. Henry Youle Hind, M.A., F.R.G.S., Published in the Year 1864.

Written for the Canadian Mining Journal.

Of the numberless minor reports written by the late Dr. Henry Youle Hind, none is of more present interest than that on the Riviere du Loup goldfields, written for a group of Boston investors.

The report proper is prefaced by a letter of transmittal from an Examining Committee. This letter, quaintly reminiscent of pre-Confederation days, sanctions "the purchase of certain lands and mining rights situated on the Riviere du Loup, emptying into the Chaudiere, in Lower Canada." It is addressed to "the subscribers to the conditional agreement, dated at Boston, May 6th, 1864." The letter itself is dated at Boston, June 23rd, 1864. The members of the committee

bore names that were prominent in the business circles of Boston half a century ago. Here they are: Leverett Saltonstall, Danl. Sargent Curtis, P. C. Brooks, Jr., S. L. French, H. B. Ward, Pliny Fisk.

The committee touches first upon the direct and easy access afforded to the district by the Kennebec road from Quebec, and by the settled character of the surrounding country. It is remarked that ten miles of the Kennebec road is macadamized, and that the district is within forty-eight hours' travel from Boston. To-day one can travel in about one-quarter of that time all the way from the city of Quebec to Boston.

The specialists engaged by the Examining Commit-

ee, in addition to Dr. Hind, to report upon the district were Mr. Russell and Mr. Tuck, Californian miners, and Mr. St. John, "a successful quartz miner of Australia."

The letter of transmittal dwells upon Dr. Hind's distinguished geological and exploratory work, and mentions that, at the date of writing, he was engaged in making a preliminary geological survey of the province of New Brunswick at the request of the Government of that colony.

"Your Committee," the letter continues, "were also fortunate enough to have an interview, arranged by appointment, with Sir William Logan, the eminent geologist of Canada, who has been for upwards of twenty years employed by the British Government in the survey of Canada and other portions of British America, who expressed to your Committee the deliberate opinion that operations properly conducted upon this auriferous tract must prove highly remunerative."

Subject to the condition that the titles upon examination proved satisfactory, the committee closed negotiations for the purchase of the lands. All legal points were submitted to the consideration of George Okill Stuart, Esq., of Quebec, "a gentleman of the highest standing in the legal profession, and now, or lately, Queen's Counsel."

Dr. Hind's report is divided under seven heads, to each of which shall be given some attention.

### I. Geographical Features.

The tract of country to which the report refers lies on the Riviere du Loup, a tributary to the Chaudiere, which empties into the St. Lawrence a few miles above Quebec. The Metgermette, a tributary of the Du Loup, flows diagonally through all the lots in Linière. Several small tributaries flow through the lots into the Du Loup.

East and west of the Du Loup the country rises to a plateau in some places in the form of an escarpment on the river, in others gradually, to an altitude varying from sixty to one hundred and twenty feet above the level of the stream. Where the rise is abrupt, landslides occasionally disclose the character of the sloping cliffs. These are seen to consist of a tenacious bluish clay, holding many worn fragments of rocks similar to the Upper Silurian slates exposed in the bed of the river, and masses of unworn slate showing a local origin, also small boulders and pebbles from a northern source.

In the ancient valley of the river the blue clay may be, in some places, fifty feet thick. But by tracing the course of the tributary streams, about two miles from the Riviere du Loup, and to an altitude exceeding 400 feet, the slates are seen in position some 25 to 30 feet below the surface of the drift clays and gravels.

The blue clay is capped by a yellowish gravelly clay, also holding numerous fragments of unworn masses of slate, as well as fragments of ferruginous, easily disintegrated quartz, similar to the interstratified quartz veins in the slates beneath.

The plateaux, referred to above, vary in breadth from a few yards to several hundred yards, and are succeeded on the west by a gradual rise to the summit of the ridge dividing the tributaries of the Du Loup from those of the Chaudiere. The highest points are not more than 500 feet above the river, or, approximately, 1,400 feet above the sea level.

The Du Loup, at its summer level, has an average width of twenty-five yards, its depth not exceeding fifteen inches. At the beginning of June its mean

breadth is about thirty yards, with a depth in the channel of eighteen or twenty inches. In the early spring it rises fully five feet above its June level.

The current is very rapid, and its fall may be approximately estimated at twelve feet in the mile. In its bed are numerous boulders, mostly from the Upper Silurian slates, reefs of which cross the river occasionally.

The course of the Du Loup, within the property described, is nearly due north for a space of nine miles.

### II. Geological Features.

(a) **Upper Silurian Slates.**—The rocks consist of Upper Silurian slates. The strike is west  $15^{\circ}$  south, magnetic; but the variation being  $16^{\circ} 45'$  east, the true strike is west  $31^{\circ}$  south. The dip is southerly, at a very high grade, varying from  $72^{\circ}$  on the Metgermette to  $85^{\circ}$  on the Riviere du Loup. The slates appear in situ in many places on the Metgermette, the Riviere du Loup, and on a mill creek (lot 31, and the rear lot on the 8th. range of Jersey) at an altitude of about 400 feet above the main stream.

Reefs of these slates frequently cross the main river and its tributaries, forming rapids. Sometimes they present a banded or ribboned appearance, and occasionally a smooth reddish surface, and an arenaceous composition. When exposed to the action of air and running water they occasionally become very fissile, wearing down and disintegrating rapidly. Other bands, again, are hard and persistent, weathering red when exposed to running water. Sometimes a slab several feet square will be found to be studded with perfect cubes of iron pyrites.

(b) **Quartz Veins.**—The slates are intersected by three sets of quartz veins: 1. The largest and older veins, running generally with the strike of the slates, and often interbedded, but occasionally enlarging into branches, are highly crystalline, and composed, towards the centre, of white quartz containing cavities lined with quartz crystals. The outer portions of the veins are frequently coloured with peroxide of iron, and the cavities filled with decomposing iron pyrites, or, sometimes, with calcite or with chlorite. 2. The oblique veins.—When the slates crop out in the bed of the river they are sometimes seen to be capped with quartz, which sends numerous ramifications in all directions. One exposed reef, dipping at an angle of  $80^{\circ}$ , was found to be intersected by veins cutting them at an angle of  $56^{\circ}$  N.E. These oblique veins appear to be associated with the main veins, which generally run in the direction of the strike of the slates. Persons are liable to be much deceived by them, as they often expose a broad surface in the river; but none was found of a greater thickness than two or three inches. 3. The newest veins are the numerous small, continuous veins cutting the main veins either at right angles or obliquely. They are of more recent origin than either of the two systems described, and generally consist of quartz free from foreign material.

(To be continued.)

### PRESENT PROVISIONS OF U.S. TARIFF AS REGARDS ORES OF ZINC.

Zinc-bearing ore of all kinds, including calamine, containing less than ten per centum of zinc, shall be admitted free of duty; containing ten per centum or more of zinc and less than twenty per centum, one-fourth of

one cent per pound on the zinc contained therein; containing twenty per centum or more of zinc and less than twenty-five per centum, one-half of one cent per pound on the zinc contained therein; containing twenty-five per centum of zinc or more, one cent per pound on the zinc contained therein: Provided, that on all importations of zinc-bearing ores the duties shall be estimated at the port of entry, and a bond given in double the amount of such estimated duties for the transportation of the ores by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments, whether designated as bonded warehouses or otherwise. On the arrival of the ores at such establishments they shall be sampled, according to commercial methods under the supervision of government officers, who shall be stationed at such establishments, and who shall submit the samples thus obtained to a government assayer, designated by the Secretary of the Treasury, who shall make a proper assay of the sample, and report the result to the proper customs officers, and the import entries shall be liquidated thereon, except in case of ores that shall be removed to a bonded warehouse to be refined for exportation as provided by law. And the Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph.

#### PRODUCTION OF IRON AND STEEL BY THE ELECTRIC SMELTING PROCESS.\*

By E. J. Ljungberg (Falun, Sweden).

On the whole there is at present not much more to add to what has already been published concerning the melting of steel by use of electric current. Many types of furnace have been evolved and constructed—the Heroult, Kjellin, Stassano, Girod, Rochling-Rodenhauer, and others. It is also well known that furnaces up to a capacity of 15 tons have been built for making special steel with good commercial results. For making steel of ordinary quality the electric method still seems to be too expensive, even where cheap water-power is available.

At Gysinge, one of the works belonging to the Stora Kopparbergs Bergslag, there is one Kjellin induction furnace with a capacity of 2 tons, but as this is working as a Talbot furnace, not more than about one ton at a time is tapped.

The continuous current used in this furnace represents about 200 kilowatts, and the output in 300 days amounts to about 1,200 tons of ingots using 50 per cent. pig and fifty per cent. scrap. As no other pig iron is used except the famous Dannemora brand made by the firm, which, as every one knows, is extremely low in phosphorus and sulphur, the process can hardly be called a refining process. The product is a carbon steel of high quality, possessing some superiority over steel made by the ordinary melting processes, the quality which I would instance specially being that it is comparatively soft to work, either hot or cold, although high in carbon. It is a superior carbon tool steel. It may be of interest to state that the company makes about 15,000 tons of Dannemora charcoal pig iron annually, of which about one-third is exported and two-thirds are used at the works at Soderfors and Elfkärle for the manufacture of Dannemora Wallon bar iron, open-hearth, and crucible steel.

In the electric furnace, as well as in the crucible plant, there are also produced, among different kinds of steel, high speed self-hardening steel, tungsten steel, chromium steel, and nickel steel. Such steels can easily be made in electric furnaces when the necessary care is taken. When speaking of high quality steel all steelmakers know that the utmost care in heating, hammering, rolling, and tempering is necessary if good result is to be obtained.

For a country like Sweden, possessing practically no coal-mines but numerous waterfalls, the manufacture of iron and steel direct from ore by the agency of the electric current is of much more interest than the melting of pig and scrap to make steel. At the works at Domnarfvet extensive and costly trials have therefore been made in the direct reduction of ore during this and the past few years.

In these experiments two modifications of a furnace constructed by Mr. Wallin in Berlin, and several modifications of a furnace, constructed by Messrs. Gronva & Lindblad (the Electro Metal Company), Ludvika, have been tried. Of these it is needless to describe any except the latest form.

The accompanying drawing shows a furnace similar to a common blast-furnace, but with three electrodes fed by three-phase alternating current at about 40 volt 60 cycles, and 9500 amperes, averaging 674 horse-power, instead of tuyeres. In this furnace, which has been running for 1903 hours, there have been produced 28 tons of iron, containing from 0.95 to 3.09 per cent of carbon.

\*Paper read before the Iron and Steel Institute.

In the manufacture of this quantity there was used:—

|                                        | Tons.   |
|----------------------------------------|---------|
| Ore .....                              | 442     |
| Lime .....                             | 24      |
| Coke .....                             | 41      |
| Charcoal .....                         | 58      |
| Electrodes, total .....                | 6.5     |
| Electric current (kilowatt-hours) .... | 891,623 |

or per metric ton of pig iron produced:—

|                                    | Kilogrammes. |
|------------------------------------|--------------|
| Coke and charcoal .....            | 353.3        |
| Power, horsepower year .....       | 0.492        |
| Electrodes, effective .....        | 8.8 kgs.     |
| Wasted ends .....                  | 13.9 kgs.    |
|                                    | 22.7         |
| Pig iron from ore and lime .....   | 60.02        |
| Pig iron from ore alone .....      | 63.50        |
| Pig iron per horsepower year ..... | 2.03 tons    |

The temperature of the escaping gases from the furnace is generally very low, and contain on an average about 22 per cent. of carbon dioxide (from 8 to 41 per cent.). The amount of carbon monoxide varies from 39.4 per cent. to 61 per cent. The gases contain practically no nitrogen, but steam from the water in the ore, lime, coke, or charcoal is present.

The efficiency of the electric current ought to be higher than hitherto, if the considerable loss of heat by cooling water and radiation can be reduced. These losses seem to be about 30 per cent.

No air whatever is used in the process, and the gases are produced from the carbon in the charcoal and coke and the oxygen in the ores ( $\text{FeO} + \text{C} = \text{Fe} + \text{CO}$ ). Either charcoal or coke may be used, but the consumption of fuel will be practically the same in either case.

According to the description of the inventor, the figure shows a vertical section, through the furnace

which consists of a lower portion or smelting chamber, corresponding to the hearth of a blast-furnace, and a top section or shaft. The latter is supported on columns, which prevent any weight from bearing on the arch of the smelting chamber. The latter is so proportioned as to provide a considerable amount of free space between the charge and the arched roof through which the carbon electrodes project into the charge. The brickwork is thus protected against any very high temperature, and remains a non-conductor of electricity. This is an important feature of this furnace, since experiment has shown that if the electrodes enter the chamber at the point where the charge touches the walls, a very high temperature is generated at this point; the brickwork is destroyed and becomes a conductor of electricity, giving rise to a more or less complete short-circuit. The brickwork may be further cooled by means of a blast of cool gas taken from the top of the furnace and blown in round the electrodes with a fan, no heat being lost by this proceeding.

The ore and fuel are crushed to a suitable size, and are fed into the top of the furnace through the bell hopper in the usual way, the ore being partially reduced by the carbon monoxide rising through the charge. The latter spreads out in the smelting chamber, as shown, and the reduction is there completed. Since the electrodes project well into the charge, the highest temperature occurs in the centre of the latter, and the brickwork is thus kept cool compared with the walls of an ordinary blast-furnace.

It will be seen from the figures given in the paper that a step has been taken in the direction of replacing a considerable part of the fuel used in making iron and steel by the electric current, and that the problem is technically solved. As regards its commercial value, it is too early to make any definite statement yet, but this will be readily understood by all iron and steel makers when they reflect how many years it has taken to bring the Bessemer, the open-hearth, and the basic processes to their present state of perfection.

## IRON ORE DEPOSITS OF NOVA SCOTIA.

(Continued from issue of Sept. 15.)

\*Notes from report by Dr. J. E. Woodman, issued by Mines Branch, Department of Mines, Ottawa.

### The Nictaux-Torbrook Basin.

**Location, extent and ownership.**—The important iron ore field of Torbrook and Nictaux is situated in eastern Annapolis county, on the south side of the Annapolis river valley and against the side of the highland to the south, locally called South mountain. The distance from the old Leekie mine to Wilmot, on the Dominion Atlantic railway, is 3 miles; from the Wheelock mine, 4.8. From Wilmot to Acadia mines, via Midland division (Windsor to Truro), 137 miles; via Windsor Junction, 153 miles.

It stretches from the Kings-Annapolis county line on the east to the granite back of Cleveland mountain on the west, a distance of seven miles. Its breadth is in places 15,000 feet from the granites on the south to the Triassic rocks on the north, but the utmost width of probable ore-bearing rock is 11,500 feet. Thus the ter-

ritory within which iron ore is likely to be found may be roughly placed at fifteen square miles.

The iron ore deposits here, as at Clementsport, are held with the land, hence no royalty is paid upon the mineral. A large part of the district is now owned or controlled by the Annapolis Iron Company. The Londonderry Iron and Mining Company owns some of the remainder of the territory and controls still more. A few farms have not been included in these operations.

**Topography and general features.**—The district is part of an open farm country, easy of access at all times. The general trend of the topography is north-east in the main part of the field, owing to the line of slope of South mountain and the direction of Torbrook or Black river. This stream, flowing from South mountain northward into the centre of the basin, there turns north-east almost to the county line; thence north-west, passing out of the basin to the Annapolis river. The valley is narrow and steep where it emerges from South moun-

tain, but becomes broad and flat in the main part of the basin, so that few outcrops can be found along it.

North-west of this river, where the mines are situated, the land is again higher, although in no part more than 400 feet above the stream. Within half a mile of the latter it begins to decline toward the Annapolis river.

It is upon this very broad, ridge-like eminence that the north line of ore outcrops is situated, in the form of three, or possibly more, beds of iron ore interstratified with the sedimentary rocks of the region.

The southern line of ore, similarly situated with reference to the country rock, is found well up on the side of South mountain and everywhere at considerably greater altitude than the other, within a short distance of the granite which covers a large part of western Nova Scotia. The outcrops and openings are high on the west, declining eastward, because the strike of the deposit is slightly oblique to the trend of the South mountain escarpment, diverging in that direction. In like manner the altitude of the north line of the ore deposit declines eastward, being 365 feet at the Wheelock mine on the west, 131 feet at the Leckie mine on the east, and somewhat lower at the crossing of Torbrook river still farther east. The grades from the South mountain iron ore deposit towards the railroad on the north are rather severe at any point.

**Transportation.**—Transportation is not a serious problem in this field. For some years a spur line of standard gauge has run from Wilmot station southward 3 miles to the Leckie mine, over an almost level country. Thence it is 1.8 miles south-west to the Wheelock mine, with a rise of 234 feet. In 1906 the standard gauge track was extended to this part of the property, and in 1907 to a newer mine of small size, the Martin, somewhat farther west. As the Leckie mine is not now in operation, all the ore is conveyed from the Wheelock and Martin openings, which are nearly in the centre of the property, to Wilmot station. The district is controlled, and in large part owned, by the Annapolis Iron Company at Londonderry (Acadia Mines), where it is smelted into pig iron.

From the Wheelock mine to Nictaux station on the west is 2.27 miles, down a steep grade. Nevertheless it would not be difficult to connect with the Halifax and South-western railway at that point. This would insure opportunity to ship ore on the Bay of Fundy at Victoria beach by one rail haul, as this road belongs to the same interest as the first-named.

The South Mountain range of iron ore has not yet been opened sufficiently to warrant laying tracks from any present rail line, and greater difficulty would be experienced in grades.

Present transportation to Acadia Mines is unsatisfactory, as the ore has to be hauled over two lines. The Dominion Atlantic railway is used as far as Windsor in any case. From there two routes are possible; in one the ore goes to Truro by the Midland division of the Dominion Atlantic; in the other to Windsor Junction, the Dominion Atlantic and the Intercolonial sharing in this, thence to Truro and Londonderry by the Intercolonial railway. By either route freight charges are an important item.

**Water power and wood.**—Two streams of some size run through the district—the Nictaux and Torbrook rivers. Neither has natural storage in the form of head water lakes of any importance; and Torbrook (or Black) river has a valley so shaped that at no suitable

point could it be dammed without great injury to farming interests.

Nictaux river flows northward throughout the breadth of the district in a narrow valley which broadens when the Triassic rocks to the north are reached. This valley could be dammed at a number of points forming a succession of storage basins. As it is, there but one dam, a short distance above the falls at Nictaux.

The horse-power of the stream was taken during an unusually dry time, when the stream had shrunk to small proportions. Assuming the installation of power at the lowest feasible point—where the stream valley widens, north of the village of Nictaux—a head of 12 feet could be secured from the site of the old Nixco dam with 5,800 feet of piping, and a minimum of 13 h.p. without such storage as to increase the minimum volume of water. From the present dam at the falls a head of 77 feet can be secured, and the estimate gives 135 h.p., showing that the increased discharge counteracts the decreased head. This, of course, could be much augmented by proper storage. Previous estimates, made in private reports on the district, range from 250 to 75 h.p.

There is no timber in the district, and none of value for a few miles to the south. But in the heart of the south country is a larger amount of excellent wood both hard and soft, and of several varieties each, than many mines or electric smelters would require. The timber country is all controlled by one or another of the large lumber companies, with whom negotiations would have to be made.

**Local Smelting.**—The possibility of a new western smelting centre is here reverted to, in order to show the relations of the different factors in the case.

The problem presents three aspects. According to one, the district as a whole may be regarded as a smelting centre, the coal being brought from a distance. Second, the ore may be shipped to an existing furnace as Londonderry, Sydney or Sydney Mines. Third, it may be shipped to a new centre of reduction, to which also coal would have to be brought.

(1) There is undoubtedly sufficient ore in the basin to supply a moderate plant for so long a time as to warrant installation if other factors are favourable. In such event all the coal would have to be brought from a considerable distance, as western Nova Scotia south of Cumberland county possesses none. Coal could be had from any Cape Breton district by water shipment to Annapolis Royal, thence by rail to Torbrook or Nictaux if the works were there. From the Pictou field coal would come by rail from Stellarton or Westville to Pictou Landing, and by water to Annapolis. From the present Cumberland field (Springhill) coal would come by rail to the Cumberland Coal and Railway Company shipping piers at Parrsboro, thence by vessel across Cobequid bay to Annapolis. Instead of using Annapolis as a debarking point, Victoria Beach, opposite Digby, might be employed, but this would necessitate a longer rail haul.

Limestone could be brought from near Windsor and from other points in Hants county. That near Windsor is an especially good grade of shell lime of lower Carboniferous age, similar in many ways to that of Red Island, Cape Breton, used at present by the Nova Scotia Steel and Coal Company.

The distance from Wilmot, where the spur line leaves the Dominion Atlantic main tracks, to Annapolis is 32 miles; to Victoria Beach, 40 miles; and to Windsor

Diagrammatic section across centre of Nictaux-Torbrook basin, to illustrate possible synclinal structure.

54 miles. In considering Victoria Beach for shipping, it must be noted that the Victoria Beach railway is a part of the Halifax and South-western system. Haulage from Torbrook would have to be over two lines at present, but by making connection at Nictaux station a single line would handle the ore.

In making calculations for large scale operations upon any but the present status, it must not be forgotten that the Clementsport district contains ores of a character sufficiently similar to those of Torbrook to bring its successful exploitation within the range of possibility.

(2) According to the present arrangements, the Annapolis Iron Company delivers its ore by rail to the Londonderry Iron and Mining Company at Acadia Mines. The two are closely allied financially, and the latter company owns outright the Leckie mine, lately closed down, and several other parcels of ore-bearing

free from phosphorus and remarkably low in sulphur but high in lime and magnesia. Moreover, the Londonderry ore is porous, reducing easily during its descent in the furnace, while the Torbrook ore is dense. It would seem, therefore, that any plan looking to the mixing of these ores should receive consideration, and that any scheme for a new western reduction centre should take into account the presence of the Londonderry iron ore range.

Leaving aside the financial problems engendered by present ownership, a smelter erected either at Parrsboro or Annapolis would fulfil the necessary conditions of situation and availability. In the former case the ore from the Torbrook field would be shipped at Annapolis or Victoria beach; and limestone, in part at least from Windsor on Minas basin—all these being situated on embayments on the Bay of Fundy. The distance from Annapolis by water to Parrsboro is 100 miles; from Vic-

Diagrammatic cross-section of Nictaux-Torbrook basin, on theory of simple synclinal folding

ground. Both companies own both land and ore on some farms, and only the iron ore rights upon others.

The ore is shipped from the property (at present the Wheelock and Martin mines only) to Wilmot, thence via main line of Dominion Atlantic and Intercolonial railways to Acadia Mines.

It would be practicable, at no greater cost, to ship the ore by water from Annapolis or Victoria beach to Mines or the Dominion Iron and Steel Company at the Nova Scotia Steel and Coal Company at Sydney Sydney. In this case the water haul would be approximately 650 miles.

(3) The last possibility is that of a new smelting centre. That the ores of Torbrook and Londonderry well supplement each other is readily seen when it is noted that the former is of good low grade quality, high in phosphorus and in part high in lime, and low in sulphur in most instances; while the latter is especially

torria beach, 84 miles; from Windsor, 30 miles. The coal would come in part from Springhill by a short haul to Parrsboro, as much does at present; and water shipment from the Pictou and Cape Breton fields would be feasible. Should western Cumberland county be developed as a coal field, fuel from the centre of the basin would come by rail with a much shorter haul than from Springhill; and that from the western rim of the basin would be shipped probably from Shulie, which is capable of being converted into a harbour.

For ore from Londonderry a road would have to be built along the north side of Cobequid bay. As a charter has some time since been granted for such a road and survey made, its construction may be looked upon as feasible.

In the case of erection at Annapolis such material as would come direct to Parrsboro by land in the first instance could be shipped by water thence to Annapolis

### History of Previous Operations.

**Early Endeavors.**—The existence of iron ore in the basin appears to have been known very early in the nineteenth century, and a small Catalan forge was set up at Nictaux Falls, in which a few tons of bar-iron were made. In 1825, as related in Part 11, chapter 1, the Annapolis Iron Mining Company was formed, erecting a large smelter on Moose river, in the Village of Clementsport. Part of the ore there treated came from the western part of the Nictaux-Torbrook field, near Nictaux river. Later a charcoal smelter was erected at Nictaux, and the veins of ore explored with some thoroughness. Slag from this furnace may even to-day be found in great abundance in the river bed.

In 1855 an English company mined a shell magnetite in the western part of the field, spoken of locally as the Shell bed, but never demonstrated to be the same as the long Shell bed to the east. At least two openings were used—one close to the furnace at Nictaux Falls, the other about two miles east. Limestone for flux was brought from St. John to Port George, on the Bay of Fundy, ten or eleven miles from the furnace, whence also the pig was shipped. The works closed down about 1860, because of too great cost of production.

**Page and Stearns.**—In 1870 Page and Stearns started to make rail connection between Middleton and Bridgewater, on the south shore of the province. In connection with the promotion of this scheme they opened ore pits at many places west of Nictaux River and as far west as Lawrencetown, six miles from Nictaux, all in magnetite. Some property was acquired, still known as the Stearns property of Cleveland mountain and the Page and Stearns property of Torbrook. Much more of the country was taken under lease, with the intention of development when their railway, the Nictaux and Atlantic, was completed. The scheme came to nothing, however. The railway was later completed as the Nova Scotia Central, and recently taken over as part of the Halifax and Southwestern system.

In all this early work the Leckie vein appears not to have been touched, all interest centering upon the Shell bed and various magnetic fossiliferous beds to the west. In these were made open cut trenches, often of considerable length, especially on the Shell bed from the Fletcher Wheelock farm west. No underground mining was attempted.

**Leckie Mine.**—In 1890 Major R. G. E. Leckie, then manager of the Londonderry Iron Company, took royalty options upon certain iron ore deposits in the eastern part of the district, where since has been located the Leckie mine; and in 1891 operations were started. In 1896 the property became idle, because of closing down at Londonderry and an absence of any other market for the ore. Previously the Leckie ore had gone in part to Londonderry, part to Ferrona.

In 1903 the mine was reopened by the Londonderry Iron and Mining Company, coincidentally with the reorganization of the Acadia mines, running until the summer of 1906, when it became exhausted and was shut down. Evidence will be offered later indicating that, while all the ore obtainable from the old shafts had been extracted, the same horizon may carry more lower down.

**Annapolis Iron Company.**—The Torbrook district has been identified with Londonderry since 1890. Recently the Londonderry interests obtained an option upon a large part of the district; and besides widespread surface prospecting and sinking of numerous

boreholes, developed the beginning of a mine on the Shell bed, on the Fletcher Wheelock property and close to the Torbrook-Nictaux road. During the winter of 1906-07 these options were closed, a new company, called the Annapolis Iron Company, being formed to operate. Much the same financial interests are concerned as in the Londonderry company. Recently underground development has commenced in the Leckie vein of the Martin property, west of the Wheelock mine, with the purpose of making a new mine there.

**Output.**—The beginning of the arrangement to take ore from Torbrook (Leckie mine) to Londonderry dates back to 1889, and in 1890 a shipment is recorded of 1,365 tons; in 1891, 7,273 tons; 1892, 27,114; 1893, 29,839, of which 20,000 went to Londonderry, the remainder to Ferrona; 1894, 21,664, divided between the two furnaces; 1895, 29,940; 1896, 19,944 up to July, when the Leckie mine closed down. It reopened in April, 1903, and in the remainder of the year nearly 5,000 tons were mined. For 1904 no public record was made of the output; in 1905 it was 14,538 tons; in 1906, 27,000.

For the early years, during the life of Nictaux furnace, no adequate records exist.

### General Lithology.

**Series represented.**—The western part of Nova Scotia, south of the Bay of Fundy, is largely underlain by the pre-Cambrian gold-bearing (Meguma) series and its associated igneous rocks. The latter include chiefly granites, of which the main body is a great massif occupying many hundred square miles and forming the northern margin of the main plateau of the province, to a height of 600 to 700 feet. To the north of the granite the sedimentary rocks are topographically much lower, and the escarpment thus formed is called South mountain.

Running along the face and base of this escarpment, intermittently from near Weymouth on the west to the Nictaux river, thence without interruption nearly to the Avon river on the east, are various types of sediments, ranging from the upper group of the pre-Cambrian gold-bearing series (Halifax formation) to the Devonian. In part these form a portion of the highland, or hilly country hardly lower in altitude; in part they are so low as to grade into the flat Triassic topography to the north. All are invaded by the granites or their basic marginal equivalents, which to some extent assume the form of diorites.

**Inglesville district.**—Of these sedimentary areas, the only ones of interest in this connection are (1) the Inglesville district and (2) the Nictaux-Torbrook basin. The first is bounded on the north by the Triassic sediments of the Annapolis valley and on the south by the main granite mass; on the west lies part of the main granite which south of Lawrencetown reaches northward to the Triassic. On the east, at Inglesville, a broad tongue reaches from the main mass of the granite up to the Triassic and cuts this iron area off from the Nictaux district, of which it is a logical extension.

Its rocks are in general similar to those of the eastern basin, and it contains a certain but quite unknown amount of bedded magnetic iron ore. But the country is little prospected, and natural outcrops are few. Nothing in detail is known of its structure, or of most of its iron.

**Eastern areas.**—From the east side of the granite tongue above mentioned sediments stretch without complete interruption for many miles, to the Carboniferous of the Minas basin. The detailed geology of this part

of the country is at present being worked out by the Geological Survey, and it is sufficient to say that the studies to date show a succession of rock series occupying areas that are much elongated parallel with the margin of the granite plateau to the south. It is unnecessary to enumerate these areas, the rocks of which appear to be conformable throughout a single unit, but, in some instances at least, unconformable with those of adjacent areas. Some are regarded as of the same age as those of the Torbrook basin; but thus far no iron ore deposit of importance has been discovered in them.

The limits of the Nictaux-Torbrook basin have already been noted. It appears to include two of the series represented to the east, according to the present views of the Geological Survey. Of these the upper, of Silurian age, contains the iron ore. Paleontological evidence as to age is abundant, and in published references hitherto part at least of the strata have been called lower Devonian.

**Sediments of the basin.**—The stratified rocks of the district include coarse and fine sandstones, and their altered equivalents as quartzites; gray, green, bluish and red shales, and their metamorphic forms possessing a slaty cleavage; and limestones. The last are, in certain instances, ferruginous, passing into hematite and magnetite.

The south side of the basin is everywhere occupied by dark green, gray and black slates. In the eastern portion, the centre and the area north of it present fawn, green, black and gray shales, and many bands of quartzites of various colours. These are all shown well in traverses along Saunders, Messenger, Burns, and Spinney brooks, and in the lower and eastern portion of Black or Torbrook river.

At the extreme west, a complete traverse of the basin can be had upon Nictaux river; and a section of the southern half upon Torbrook river, approximately three-quarters of the distance toward the western end of the district. In both these only the gray and black rocks appear, none of the fawn, light green or very light gray, coming to the surface.

The quartzites have some importance in any attempt to work out structure; as one apparently characteristic bed is found at known distances north of the zone of iron ore on the north side of the basin, and a similar bed is found in places south of the South mountain iron ore deposits. The quartzites in the centre of the basin at the east end are in many instances repetitions. Very coarse sediments are not known in the rocks of this basin.

**Eruptives.**—The general distribution of the granite has already been mentioned. Toward the margin, in places the rock becomes darker and finer, turning to diorite; but this is by no means without exception. In addition to the main mass of intrusives there are many isolated bodies of dark and more or less basic igneous rocks, of medium to fine grain. The number and distribution of these are not known.

Their chief importance in relation to the iron ore deposits consists, first, in the influence which they may have upon the distribution of the latter, second, in the metamorphic effect of the intrusives as a whole upon the hematite. As to the former, it may be said that in at least one place, west of the Leckie mine, an apparent absence of the ore along a line in which it should be found seems best explained as the effect of the presence of a boss of intrinsic rock immediately to the north. On the other hand, to the west on the properties of M. Hoff-

man, Page and Stearns, and Josephine Wheelock, the Shell vein, 80 feet south of the Leckie is not affected. But the Leckie is thin throughout this distance and as far west as beyond the Wheelock mine, becoming good once more on the Edwin Martin property. While the western part of this lean portion of the Leckie is quite far from any boss, it is possible that the depauperization is the effect of the presence of two intrusive masses north of the ore.

**Metamorphism.**—Metamorphism of both dynamic and contact types is shown in most of the field. In the north-eastern portion the bed rocks, and to a certain extent others, lack slaty cleavage; even here, however, the light coloured sandstones have altered to dense quartzites. The southern part of the field has everywhere slaty cleavage in the finer rocks; and this is true wherever in the basin the gray sediments are found without the red strata. In part this is the result of dynamic changes.

However, on the south side of the basin there is a progressive increase in metamorphic effect westward, and inspection of the map shows that there the granite to the south approaches nearer. The western end of the district is all much more altered than the eastern, the slates being harder and the coarser rocks more massive. This appears to be due to increasing proximity of the granite tongue behind Cleveland mountain.

**Ore beds.**—The iron ores of the basin are all of the Clinton type, interbedded with the strata, and all originally hematites. In the east this is still true, both of those on the north side of the basin and of those on the south. Westward all the southern ore deposits and a part of the northern become magnetic; and west of the Bloomington road, between Black and Nictaux rivers, there are no openings upon non-magnetic ore. This appears to indicate that the change from  $\text{Fe}_2\text{O}_3$  to  $\text{Fe}_3\text{O}_4$  is a metamorphic effect depending upon the action of the granites.

This has another bearing. The age of the granites can be shown to be early Devonian. In exerting a metamorphic action upon the iron ore, they stamp the latter as of earlier age.

Clinton ores should possess great continuity on the strike; and in the Torbrook district two beds on the north side and one on the south can be traced for a long distance. Of the former, the Leckie can be identified for 15,000 feet, the Shell bed for 13,300 feet, with a probable extension westward. The South Mountain vein can be identified with moderate probability for 10,000 feet, and with fair possibility of its extension to 19,000 feet.

Little is known of the depth, except in the Leckie mine and in one or two of the calyx drill holes. The former lost the iron ore at 330 feet in the Woodbury shaft, not because of lack of concentration, but from pinching of the walls. This is 200 feet below sea level. The Fletcher Wheelock borehole left the Lean Hematite vein, north of the Leckie, at 382 feet, or slightly below sea level.

The difficulty in tracing the Shell vein westward is due largely to the fact that in this direction there is much repetition of shell ore beds across the strike—a condition which may indicate either a number of separate ore horizons or folding.

### Structure.

The structure of the basin is of especial importance; because here, more perhaps than elsewhere in the province, should a knowledge of this feature aid in mining

development. It is to be regretted that, with all the work put upon the field by various students, there still remain several essential points to be established.

**Previous studies: Simple folding.**—It is unnecessary to expand here upon the stages by which present knowledge of the district has been reached. It is sufficient to say that up to 1905 no serious expression of opinion upon the structure had been made, other than that it is a single large syncline. This appeared obvious as in the north there are certain stratified deposits of hematite and magnetite dipping steeply south-east; and on the south are other beds, possibly identical with the first, dipping steeply north-west. From the first, it seems to have been assumed that the northern and southern beds were the same, and that the apparent structure indicated a single large syncline (see Plate).

The relation of the red beds in the east to the gray beds was not inquired into; although the presence of the former has long been known, because Messenger, Spinney and the other brooks near the county line have been justly celebrated as fossil localities. It is noticeable that, with all the collecting that has been done along these brooks, the rocks have never been divided into paleontological stages, which might perhaps prove a key to a structure most difficult to work out by lithological means.

**Recent studies: multiple folding.**—In 1905 appeared a preliminary description of the basin by Mr. Hugh Fletcher (Sum. Rep. Geol. Surv. Can. for 1904), and a reconnaissance geological map, which was of especial advantage in that it appeared at a time when large financial interests were about to become involved in the district. Both the map and the description of openings, of which by that year there were many, were the first published. It is somewhat unfortunate, however, that some of the descriptions of ore belts, where acquired from statements of other parties rather than from observation, cannot be verified.

Mr. Fletcher's field work in 1905, in the same district, led him to state (Sum. Rep. Geol. Surv. Can. for 1905, p. 120) "The work seems to prove that the rocks lie in several synclines."

Even with the evidence gathered during the field season of 1906, it would be hazardous to state dogmatically that multiple folding has been proved; although borings show the certainty of one subordinate fold south-east of the Leekie mine.

**Hypothesis of pitching synclinorium.**—What the structure traverses of the district and the lithological distribution of the rocks would appear to the present author to indicate are:—

- (1) That the region is one of complex folding, being a part basin.
- (2) That the longitudinal section along the strike of the axes of folds, approximately N. 40° E. (magnetic), shows a pitching of the composite fold as a whole south-westward, the angle of pitch being 10° or less. There is, so far as known, no north-eastward pitch at the south-west end of the field, so that the basin structure is incomplete.
- (3) That the red rocks in the north-east, north and north-west underlie the gray as a whole, coming to the surface in these portions, but not out-cropping in other parts of the field because hidden by the overlying gray rocks.
- (4) That the productive iron ore deposits, although not exclusively confined to the gray rocks, are charac-

teristic of them, and are therefore more abundant toward the south-west.

(5) That transverse sections of the basin exhibit several anticlines and synclines, of which the exact number and the situations of the axes are, however, not completely determined.

(6) That, contrary to expectation, the dominant type of fold in this cross-section is the anticline in the centre of the basin, the synclines being shallower; while on the north-west margin the same condition obtains, and on the south-east margin the synclines are dominant.

This means that in the eastern portion of the district the red rocks reach the surface everywhere except on the southeastern side. In the middle of the field the central rocks are covered by drift; but while the strata on the southeastern margin are exclusively gray, and also near the outcrops of the iron ore on the north-west, beyond the latter and adjacent to the Triassic the red rocks once more appear. In the western half of the basin no red rocks appear in the longest traverses.

(7) That it cannot be determined with certainty whether the South mountain ore beds are equivalents of the Leekie, Shell and Lean Hematite beds on the opposite side of the basin. Certain indications, however, point to this condition, specially their relation to a certain quartzite in both situations.

(8) That the frequency of iron ore occurrences in the western half of the field, in any traverse of the basin, may be due either to duplication of the three known beds by nearly isoclinal folding, or to the presence of a considerable number of ore-bearing strata which have separate origin. The former is as likely as the latter.

Some diagrammatic cross-sections of the basin, upon the hypothesis advanced above, are appended (Plates). They are not to be regarded as having any quantitative value, since all the factors—pitch, number, location and altitude of the subordinate folds—are still more or less in doubt; but they will serve to illustrate the principle.

**Consequences of hypothesis.**—The earlier ideas of structure involved a very deep fold in the ore-bearing rocks, allowing and requiring ultimately deep mining, should the iron ore carry throughout. The work of a few years ago assumed a number of small co-ordinate folds, so that the iron ore should be found repeated several times across the basin, possibly increasing the amount speculatively available and certainly decreasing its depth. It did not, however, account for the lack of ore in the centre of the basin at the east end and its prevalence near Nietaux river.

If the hypothesis advanced above be correct, it will account for the characteristic just mentioned; will indicate the improbability of iron ore in the centre in workable quantities until nearly as far west as where Torbrook river traverses this portion of the field; and will point to the probability of a number of ore occurrences in synclinal folds west of this stream at various points transversely across the basin. Whether these are duplications or successively new occurrences, and whether they, the South mountain and the Leekie, Shell and Lean Hematite beds on the north-west can all be correlated evidence is not yet sufficient to prove.

(To be continued.)

**NOTE AND CIRCULAR ISSUED BY THE DEPARTMENT OF TRADE AND COMMERCE.  
SPECIAL NOTE TO THE PRESS.**

The enclosed circular is being mailed simultaneously to every newspaper and other weekly and monthly publication in Canada, with the hope, in the interests of the development of Canada's export trade, that it will be published free of charge, and also that some editorial comment will be made thereon. The circular will be sent also to the members of all Boards of Trade, Chambers of Commerce and Trade Associations throughout the Dominion.

Nothing of this kind has ever before been attempted in Canada, and it will entail great labour in this Department in indexing this information to make it readily available when required. But it is to be hoped that it can be made the basis of a permanent list which will be immediately available at all times in the advancement of the Foreign Trade and Commerce of Canada.

The Department desires the name of every Exporter from the Atlantic to the Pacific, with a detailed list of the goods they are in a position to sell abroad.

When this information is furnished the Department all the Canadian Trade Commissioners in the various parts of the world will be notified immediately and the same information will be systematically indexed in the United Kingdom, one in France, two in South Africa, one in Mexico, one in the West Indies, two in Australia, one in China, one in Japan, one in Holland, and one in Newfoundland.

F. C. T. O'HARA.

Deputy Minister.

Department of Trade and Commerce.

**EXPORT BUREAU.**

Ottawa, October 1st, 1909.

The Department of Trade and Commerce desires to announce its intention of compiling an Index of Canadian Manufacturers, Exporters, and Producers generally, who desire to extend their trade abroad.

For this purpose the attached form should be executed and forwarded in the enclosed envelope to the Department without delay.

It would assist the Department materially if the details under "Articles Manufactured or Produced" be entered in alphabetical order.

The list compiled by the Department will be given the preference at all times when the names of such Canadian firms are required by intending purchasers abroad.

As the information is received at the Department it will be forwarded to all the Canadian Trade Commissioners in the various parts of the world, and be systematically indexed and be readily available in their respective offices.

Deputy Minister.

**CANADIAN PATENTS.**

The following is a list of patents issued by the Canadian Patent Office on Sept. 28, 1909, relating to Mining and Metallurgy, and furnished by Fetherstonhagh & Co., 5 Elgin street, Ottawa, Russel S. Smart, Resident:—

120773. T. L. Willson, M. M. Haff, Ottawa, Ont., processes for producing calcium silicide, T. L. Willson.

120775. M. D. Porter, Lewiston, N.Y., dehydrating apparatus, W. O. Rowe, R. S. French.

120781. W. J. Ellis, Andrews, North Carolina, Combined boilers and furnaces.

120784. J. Fleming, Lynn, Mass., regulators for poly-phase furnaces, Can. General Elec. Co., Ltd.

120807. H. S. Blackmore, Mount Vernon, N.Y., processes for dissociating fluid salts or compounds by electrolysis.

120817. J. T. Carrick, Johannesburg, Transvaal, preparation of iron compounds.

120852. F. H. Headson, La Fayette, Ind., metallic compounds and processes of making same.

120857. A. C. Higgins, Worcester, Mass., methods of treating illuminous materials.

120857. L. S. Lachman, New York City, processes of electric welding.

120901. H. L. Orr, Georgetown, Wash., ore separators and concentrators.

**THE NEPHELINE AND ASSOCIATED ALKALI SYENITES OF EASTERN ONTARIO.\***

For a number of years two of the most capable geologists connected with our Canadian Survey have been studying an important area of the Archean in Eastern Ontario. Their work has been the most detailed and elaborate yet accomplished by the Survey, and we may hope soon to have in our hands a profound and illuminating volume on the Haliburton region. In the meantime the two maps prepared in connection with the work have been distributed and have proved of great interest, and several scientific papers on special points of the geology have appeared, the most important being the pamphlet mentioned above.

In the paper on Nepheline and Associated Alkali Syenites Dean Adams and Dr. Barlow have prepared what everyone expected from them, a most careful and thorough petrological study of a very interesting group of rocks, a group unique in various ways, such as the constant association of nepheline syenite with crystalline limestone, and its frequent association with corundum.

The paper includes an elaborate study of the minerals occurring in the group of rocks and the petrographical features and chemical composition of the various rock types, the new quantitative classification introduced a few years ago by Iddings, Cross and Washington being made the basis of classification. To old-fashioned petrographers the new names still have a look of strangeness and artificiality, though some reform in rock nomenclature was certainly needed.

From the economic point of view the most interesting feature of the work is the account of the great corundum deposits near Craigmont, probably the most extensive in the world. The beautiful blue sodalite occurring in Dunnannon township and elsewhere is already of some importance as an ornamental stone.

The paper is excellent and there is little to criticise as to form or matter, unless perhaps to suggest that the good pioneer work of Dr. Miller, of the Bureau of Mines, in tracing out the long bands of corundiferous rock should have received a little more emphasis.

One naturally compares the work with that of Brögger on the Scandinavian nepheline rocks, but the two areas are so different in almost every respect that little is to be gained from this. It is a satisfaction to find a paper so finished and of so high a standard coming from Canadian Petrographers.—A. P. Coleman.

\*Trans.—Roy. Soc. Can., 3rd series, 1908-9, Vol. II., Sec. IV. Frank D. Adams and Alfred E. Barlow.

## EXCHANGES.

**The South African Mining Journal, July 3, 1909.**—The Transvaal authorities are proposing to increase death duties in the Transvaal from one per cent., the present rate, to ten per cent. The South African Mining Journal comments caustically upon this. In an editorial headed "How Not to Attract Capital," the Journal predicts that the Transvaal will suffer heavily from this imposition. Instead of sweeping away altogether the estate duty, the Government actually contemplates magnifying this industrial handicap tenfold. . . . In every department this young colony is crying out for more capital. The latest proposal of the Government promises . . . to prove a most effectual deterrent to the oversea investor."

**Electrochemical and Metallurgical Industry, October, 1909.**—Our contemporary, commenting upon the need of a uniform nomenclature for iron and steel, recommends that leading societies in Great Britain, the United States, Germany, Sweden and France each appoint one member of a permanent international committee, each member to be appointed for one year only, so as to guard against too great fixity in the personnel of the committee. The functions of this committee will be to recommend such changes in existing nomenclature as it deems absolutely necessary for guarding against commercial dishonesty, and to recommend suitable and correct names for new commercial products as soon as they appear.

**Mines and Methods, Volume I., No. 1, September, 1909 (Salt Lake City, Utah).**—This is a new venture in technical journalism. Mr. Claude T. Rice is the editor and publisher. Mines and Methods will touch not only upon the subjects implied by its title, but will do its best to see that shareholders in mining corporations get a fair show. Curiously enough, this first number has not one advertisement. Editorially this is explained. Mr. Rice wishes to show the goods first, and then get after the advertiser. Possibly this is a good plan.

Anyway our new contemporary is attractive and instructive. If more room is needed there are several periodicals that can well be spared to make the necessary space.

**The Colliery Guardian, September 24, 1909.**—The Guardian dissects the portion of the second report of the Royal Commission of Mines, that deals with the subject of ventilation. Before a final report is made, much difficulty is expected. The debated point is whether the presence of two per cent. or three per cent. of firedamp is to be taken as the regulation minimum. The mine owners contend that, for practical purposes, a percentage of three per cent. is a proper minimum. The Commission evades the difficulty by recommending that "every reasonable endeavour be made to maintain such a standard of ventilation as to prevent the appearance in any open and readily accessible position of a fully formed 'cap' on the lowered flame of the safety lamp. . . . Enquiries are being made as to the percentage of firedamp that constitutes a fully formed 'cap.'"

The Guardian points out that, while a percentage standard will surely be fixed, the difficulty will be to establish one that is neither too high nor too low. "Just

as a standard timbering distance has not promoted safety, principally because it is usually too liberal in cases of excessive danger, too high a standard of ventilation would lead to a sense of false security and tend to override the faculty of discrimination. On the other hand, too low a standard would be equally objectionable owing to the impossibility of establishing it in practice."

**The Engineering and Mining Journal, October 2, 1909.**—A hot-blast copper smelting furnace, of small capacity, built for mountain transport, and adapted to the needs of the small operator, is described by Mr. P. A. Babb. The New Model hot-blast furnace is made in sizes having capacities ranging from 5 tons to 50 tons, and requiring from 1½ h.p. to 25 h.p. The shipping weight of the smallest size is 2,000 kilograms, that of the largest size 8,000 kilograms.

The only radical change in design is the elimination of tuyeres. Instead of the tuyeres there is a continuous opening of an inch or two in height forming the blast-way into the stack, and situated between the crucible and the stack. The crucible during the operation is set into the wind-box and extended to the blast-way.

**The Mining Journal, September 25, 1909.**—Forty tons of asbestos, valued at £1,600, were raised in the Pilbara gold district, Western Australia, in 1908. But the country is full of promise. A paper by Mr. C. W. Marsh in the current number of the Mining Journal gives a deal of useful facts and figures concerning the asbestos formation at Marble Bar, practically in the geographical centre of Western Australia.

The asbestos occurs here in portions of two greenstone dykes, running north and south. The eastern dyke has the appearance of diabase. The character of the western dyke is obscure. Its freshly fractured surfaces are greenish-black; its weathered surface is red. It is principally along the junction of these two rocks that serpentine rock occurs most persistently.

The richest asbestos ground is that which has been altered most intensely, and the characteristic features of the asbestos have apparently been governed by the character of the containing rock and the changes through which it has passed.

Much of the rock carrying veins of from ⅛ inch to ¾ inch in thickness will average 30 to 40 per cent. asbestos, and reasonably large working areas will average 20 per cent.

Working costs, as compared with those tabulated by Mr. Fritz Cirkel, will be considerably higher than Canadian costs. The climate is more advantageous, but the mineral is of much lower grade than the Quebec asbestos.

**The Mining World, October 2nd, 1909.**—A timely article, entitled "Gold Recovery by Electrolytic Amalgamation," appears in this issue. The writer, Mr. J. H. Jory, compares electrolytic amalgamation with cyanidation. By way of introduction Mr. Jory quotes this paragraph from a recent writer: "The electrochemical system of amalgamation is designed to extract from the sands or pulp all gold not encased. It is an entirely new system, designed to do the work of the ordinary mill-plate, including the treatment of slimes, and at the same time to extract gold that cannot be

saved by the usual mill practice, and that otherwise would require cyanide treatment. All this is done in one inexpensive and continuous operation, requiring practically no more outlay for installation and maintenance than the usual mill-plate. The system also furnishes a method by which black sands, desert deposits and many low-grade propositions can all be profitably worked. The broad claim made is that it will save all gold not encased."

This last claim, of course, is more than can be postulated for the cyanide process. Many minerals either prevent or render problematical the use of cyanide on certain ores.

The electrolytic amalgamating machine of standard size has a capacity of 100 tons per 24 hours. The demonstration machine, now in use in the laboratory of the Noble Metal Recovery Company, at San Francisco, has a capacity of about 6 tons in 24 hours. A very much smaller assay machine has been worked for some time, and has been found entirely reliable for research investigations.

For ores a fineness of from 30 to 150 mesh has been found necessary. For black sands, etc., no further comminution is required.

Examples are cited, covering a variety of different ores, where all or practically all the gold was saved. As in cyanide practice, so here each ore is a law unto itself. But with electrolytic amalgamation, slimes present no difficulty. Indeed it is pointed out that none of the mechanical and chemical limitations inherent to the cyanide process affects the electrolytic method.

**The Engineering Magazine, October, 1909.**—Of special interest to Canadian cement manufacturers is a short article in this number of the Engineering Magazine. Mr. F. Fisher, discussing marl deposits, states that experts and public alike cherish wrong ideas concerning the fitness of marl for making Portland cement. The expert has an unreasonable prejudice against all deposits, while to the public all marl deposits are valuable.

Mr. Fisher, conceding that most marl beds are commercially useless, points out that there are many good deposits neglected because of lack of proper knowledge of what good marl is.

Any marl, if free from sand, will make good cement, if properly handled; but to do so at a profit is a matter of much greater moment. From the cement-maker's point of view, the marl of importance is the heavy and rather granulated solid deposit, in which vegetable life has ceased, leaving a little peaty residue. Such marl is very heavy, carrying but half (or less) of its weight of water, as it is dredged from the bed. The majority of marl deposits, however, do not fulfil these conditions, but are more or less impregnated with living vegetable tissue. Marl, apparently white and in good condition, has been found to carry 85 to 90 per cent. of water.

Taking into consideration the consumption of coal involved in drying marl, the deadline between profit and loss lies at about 50 per cent. of water in the marl. With water at 40 per cent. marl is a cheaper material to use than limestone.

Very many otherwise excellent deposits are absolutely ruined by their contents of sand, either uniformly distributed to the extent of 1 to 2 per cent., or in distinct layers; but so disposed that it is impossible to excavate the marl uncontaminated with more or less sand. This condition is fatal. The sand can neither be removed nor ground to the requisite fineness.

When a lake or marsh can be drained and the material dug "dry," the loss is low. Dredging means a loss of about 50 per cent. on a 6 foot or 10 foot deposit. Where draining is not possible, centrifugal pumps are often used to advantage.

Neglecting to determine the water content and the sand content of marls has thrown the industry into an undeservedly bad position.

## PERSONAL AND GENERAL.

Mr. R. R. Hedley is in Rossland, B.C.

Mr. Eugene Coste has returned from Alberta.

Dr. W. G. Miller visited Gowganda early in October.

Mr. D. G. Drinnan, late superintendent of the collieries of the Crow's Nest Pass Coal Co., was in Toronto recently.

Dr. A. M. Campbell, of Ottawa, has lately inspected several of the old silver mines of Thunder Bay District, including the Beaver.

Mr. Charles Fergie is back in Montreal from northern British Columbia, where he made an arduous journey examining coal prospects.

Mr. Robert Coulthard, formerly of the Crow's Nest Pass Coal Co., has accepted the position of general manager of the Canada West Collieries, Alberta.

Mr. Reginald E. Hore, of Toronto, formerly instructor in the University of Michigan and in the School of Mining, Kingston, Ont., has been appointed instructor in petrography in the Michigan College of Mines, Houghton.

Mr. H. H. Stock has been appointed professor of mining engineering at the University of Illinois. For the past 11 years Mr. Stock has filled the chief editorial chair of Mines and Minerals. His experience of mining is broadly based upon years of work and observation.

Messrs. Bateman & Brown, Cobalt, Ont., announce that they are prepared to undertake the management, examination and development of mining properties in the Cobalt district. The members of the firm are qualified by varied experience in Mexico, the Western States and Canada. Mr. Bateman is engineer for the T. & H. B. Company; and Mr. Brown for the Silver Cross, Belmont and other mines. Cobalt will be the headquarters of the new firm.

Hon. William Templeman, Federal Minister of Mines, has returned to Ottawa after a long tour through the Yukon and Atlin. Mr. Templeman is said to have been greatly impressed with progress made in the Yukon. He states that at the Tantalus Colliery, 40 miles from Dawson, a large generating plant is being erected to supply power direct to the hydraulic plants within a radius of 50 miles.

The following gentlemen were elected to membership at a Council meeting held on the 1st. instant:—

Members—Paul Hammerich, superintendent Robertson Asbestos Mining Co., Thetford Mines, Que.; Albert J. Hewitt, superintendent Beaver Consolidated Mines, Ltd., Cobalt, Ont.; Harry A. Morin, Box 607, Gowganda, Ont.; W. P. D. Pemberton, St. Charles Street, Victoria, B.C.; Wm. P. Williams, West Canadian Collieries, Lille, Alta.

Associate—Andrew Laidlaw, Spokane, Wash., U.S.A.

Student—L. J. Duthie, Cobalt, Ont.

## SPECIAL CORRESPONDENCE

## NOVA SCOTIA.

**Glace Bay.—The U. M. W. A. Strike.**—At this writing the U. M. W. A. strike completes the third month of its ill-starred course, and not even the oldest inhabitant in his most reminiscent moments can remember a more calamitous period in the history of our mining industry. With the exception of the paltry strike at Langan in the very beginning of the coal trade, no serious industrial disturbance has ever occurred at the Cape Breton coal mines, and in the case of the Dominion Coal Company the present unwarranted strike is the only one this company has ever experienced. It may be that the lack of acquaintance of our people with the conditions attending a strike rendered it easier for the agents of the U. M. W. A. to induce them to go light-heartedly into a struggle the true nature of which is only now becoming apparent.

The outputs continue to show the steadily increasing growth which they have maintained since the first days of the strike. The figures for the months of the strike are as follows:—

| Month.              | Total Output. | Average<br>Daily Output. |
|---------------------|---------------|--------------------------|
| July . . . . .      | 136,000       | 4,200                    |
| August . . . . .    | 154,000       | 5,900                    |
| September . . . . . | 180,000       | 7,200                    |

The number of men at work, as indicated by the increased outputs, is steadily being augmented. The company practically ceased importations during September, and a large proportion of the output increase is due to returned strikers. Many men who feel that they have been deceived by the representations of those who brought on this strike and would like to return to work lack as yet the courage to come back, but it is not expected they will hesitate much longer. Most of this class of men would long ago have been back at their work were they not afraid of physical violence from the strikers, and their fear is not unfounded. At the end of September the number of men working for the Coal Company around the mines was roughly 5,000 men, of whom some 3,500 are directly employed at the collieries. The number of men out on strike is between 1,500 and 2,000, probably about 1,700. The United Mine Workers falsely state that the strikers number from 4,000 to 5,000. In the open letter addressed by the U. M. W. A. Executive to President Ross 5,000 is the figure used. To lie successfully it is prudent to make at least some approximation to the truth, or rather the apparent truth, but in claiming five thousand adherents at the mines of the Dominion Coal Company the U. M. W. A. Executive has stretched the credulity of the public beyond the limit of elasticity.

It will be seen from the foregoing figures that there is a great disparity between the numerical strength of the strikers and of the men who are at work, which renders it the more extraordinary that the authorities should not be able to stop the intimidation which is still going on.

The features of the past fortnight have been the open letter, which is previously referred to, and the arrest of the local president of the U. M. W. A. at the instance of the Dominion Coal Company on a charge of criminal libel.

The open letter to Mr. Ross was chiefly remarkable for a statement which read as follows: "Our position (that of the U. M. W. A. Executive) has always been, is now, and will continue to be, that we want the company to receive a committee of its employees to consider grievances and to remove the grievances where possible. That is all the recognition we have asked for." It is the general opinion that the U. M. W. A. International Executive would scarcely spend \$365,000 (this sum is given on the authority of the U. M. W. A.) and be prepared to spend still more for the sake of inducing a Nova Scotian coal

company to "meet a committee of its workmen," more especially as the company in question has been meeting such committees for sixteen years. The *reductio ad absurdum* has rarely been better illustrated than in this lame conclusion to the flaming diatribes of the U. M. W. A. orator, and it was very generally remarked when the letter appeared that the writer had rather weakened than strengthened the case of his employers. The letter was not, however, intended for the enlightenment of the persons who are most interested in the struggle, but is a collection of *ex parte* statements intended to impress the outside public who are not sufficiently familiar with the details of the U. M. W. A. campaign to be able to detect the omissions and perversions of fact of which the letter is chiefly composed.

The arrest and trial of Mr. Daniel MacDougall for criminal libel has been fully detailed in the newspapers, and the continuance of the enquete will doubtless throw a little more light on the methods of the U. M. W. A. It is to be hoped that Messrs. Bousfield and Patterson will respond to the invitation to tell the Canadian courts what they know.

Another interesting feature of the week has been the meeting of the Grand Council of the P. W. A. and the resolutions which were passed referring to the conduct of the U. M. W. A. this summer. The P. W. A. decided to affiliate with the Canadian Federation of Labour, which is the natural outcome of the fratricidal attack which has been made upon them by the American union. The newspapers in Cape Breton were much amused to see that Mr. James Simpson, of the Toronto Star, was not successful in obtaining the position of president of the Trades and Labour Congress, for which he laboured so strenuously when reporting the strike at Glace Bay. Mr. Simpson was exceedingly wrathful when in Glace Bay at the remarks which the local newspapers made about his predilection for the United Mine Workers, and his reports to the Star. The Provincial Workmen's Association passed a resolution stigmatizing Mr. Simpson as a "shameless prevaricator," which was almost unparliamentary. We rather think, however, that the P. W. A. and the C. F. L. will before long be able to laugh at the A. F. L., the U. M. W. A. and all the little Canadians that talk about international unionism.

**The Pirates of Trades Unionism.**—The chief attraction of the U. M. W. A. to the Nova Scotian miner has been that the U. M. W. A. was reputed to be a large, wealthy and strong union, which would enable them more successfully to withstand the forces of capitalism. The U. M. W. A. in its turn has told the Nova Scotian miner that the reason the Canadian capitalist did not approve of the U. M. W. A. was because the capitalist knew these facts, and was afraid the U. M. W. A. by the use of its big stick would force him to disgorge his ill-gotten gains. Every argument adduced against the U. M. W. A. in the Canadian press was traced to the capitalist, and was nullified because it appeared in the "capitalist press"—as our Fourth Estate is usually referred to by the U. M. W. A. agitator, and the workers were impressed with the fact that the capitalist was "scared" of the U. M. W. A.

The capitalist, we are free to admit, was "scared" of the U. M. W. A., not, however, for the reasons given by the walking delegate of that precious organization, but because he saw approaching the herald of discord, of bloodshed and strife, and of attacks on his trade and profits. "Profits" is a word which is *anathema maranatha* to the U. M. W. A., but until the social fabric is readjusted they are necessary if wages are to be paid.

The Canadian capitalist was apprehensive because of the record of the U. M. W. A. in the land of its birth, namely, the United States. There, for the past seven years, the U. M. W. A. has played the part of Captain Kidd. The U. M. W. A. Journal claims "Old Glory" for its flag, but we would suggest the

"Jolly Roger" as a more fitting emblem for a piratical organization which extends in influence by squeezing out smaller unions. The attack which is now being made upon the P. W. A. in Nova Scotia is an oft-played game with the U. M. W. A., and it is amusing to those who know the methods of the U. M. W. A. and who know the way in which the meetings of the Grand Council of the P. W. A. were watched by emissaries from Indianapolis to hear the delegates in Glace Bay speak of being "invited" to Nova Scotia. The invitation given by the U. M. W. A. to anything smaller than itself is similar to the invitation given to the lady who went for a tiger ride in Niger.

The Roosevelt Commission on the Anthracite Strike in the States found that disorder and lawlessness attended the operations of the U. M. W. A., and that an organization whose purposes could only be accomplished by violation of law and order of society had no right to exist. As in Glace Bay, the U. M. W. A. in the anthracite strike objected to the presence of the militia, on which the Commission commented: "The resentment expressed by many persons connected with the strike at the presence of the armed guards and militia of the state does not argue well for the peaceable character or purposes of such persons." Could any words be more applicable to the conditions which exist in Nova Scotia to-day? The president of the Lehigh Coal and Navigation says the U. M. W. A. made not the slightest effort to secure the arrest and conviction of the men guilty of outrages. "On the contrary, it did what it could to shield and defend them." At Glace Bay men guilty of outrages are being defended by lawyers retained by the U. M. W. A. The president of the Delaware and Hudson Company says: "The U. M. W. A. has not in the past, and there is no reason to believe it will in the future hesitate to sacrifice life, liberty, and property to gain its vicious and temporary ends. It denies the right of man to sell his labour in a free market." At Glace Bay the U. M. W. A. has yet to clear its skirts of the sacrifice of life and the destruction of property to gain its vicious and "temporary" ends. How temporary these ends are the Nova Scotian dupe will learn before next spring arrives.

On the record of the U. M. W. A. in its home the Nova Scotian operator decided it was best for himself and everybody else that the U. M. W. A. should not get a footing in this hitherto orderly and strike-free province. On the record of the U. M. W. A. since it came to Nova Scotia it is probable the Canadian public have come to the same conclusion.

One of the most contemptible of the many contemptible policies which the U. M. W. A. has in its arsenal is the way in which it attempts to sow the seeds of discord between the workmen and the management of the coal companies. At Springhill the U. M. W. A. Press Committee has not only attacked the relations of the management with their men, but has also attacked the technical skill and the financial direction of the company. At Glace Bay, as we pointed out in a previous letter, the same tactics have been pursued. The latest scare which the U. M. W. A. has disseminated through the pages of a complaisant organ is that information is to be laid against the coal operators of Nova Scotia as a body charging them with illegal conspiracy to raise the price of coal. This is just what one would expect. From the very first it has been apparent the ultimate aim of the U. M. W. A. campaign was injury to our coal trade. Our chiefest industry is fair game for the U. M. W. A., but what is most surprising is that our own provincial newspapers should join hands with the alien to work destruction on the financial bulwark of Nova Scotian credit. A long time ago we warned the Sydney Post that its endorsement of the U. M. W. A. cause was going to work havoc on the main industry of Glace Bay, and that anything which worked harm to Glace Bay would in the long run work much greater harm to Sydney and its one industry. The balance sheet of the Dominion Iron & Steel Co. for 1909 will show very conclusively what result the

Glace Bay strike is going to have on its earnings. It is almost inconceivable that responsible newspapers should allow the tortuous ways of obscure local politics to lead them into an endorsement of such an unblushing attack on our main industry as the U. M. W. A. has made this summer.

While the onslaught of the U. M. W. A. on Nova Scotia was a long-premeditated one, and would have been made sooner or later, it is questionable whether it could have been brought to a head had not Nova Scotian newspapers helped it along, and it has been an interesting study to watch the skilful way in which the agents of the U. M. W. A. have used a party press to attack Nova Scotia's financial credit, in the name, save the mark, of reform. Politicians are proverbially short-sighted, statesmen seldom, and we are forced to conclude that the crop of politicians in Nova Scotia has choked all statesmanship, else never had men been so purblind as to join hands and help the alien and the pirate. When all is said and done we must congratulate the leaders of the U. M. W. A. on their astuteness and on the manner in which they sized up the exceeding littleness of politics in Nova Scotia.

**Dominion Coal and the North Pole.**—We noticed in the last number of the Journal a dreadful effusion headed "Arctic Amenities." Sydney has seen a good deal of this kind of thing, but we do not remember to have seen any mention of the fact that the "Roosevelt" on her journey north was bunkered with Dominion coal at International Pier. Therefore in advertising their coal in future the Dominion Coal Company may justly claim that "Dominion Coal found the Pole."

## ONTARIO.

**Cobalt.**—The White Reserve Syndicate at Maple Mountain has made a six ton shipment of high-grade ore. At the present time the mine is closed down temporarily. This is not due to the condition of the mine, but to internal troubles among the directors, and also due to a shortage of funds on account of the large expenditures made in making roads, etc. This district will be connected with the Haileybury Road, of which about seventeen miles are in good shape, and it is probable that this winter the ore will be shipped out this way. Work will be started up again about the 1st of November.

The recent discovery of silver on the property of the Red Jacket Mining Co., and also the finds made in the Gillies Limit have extended the silver bearing area of the camp a considerable distance to the south. The main shaft of the property was sunk to a depth of 125 feet on a large calcite vein, and drifts were started from this point. The silver was found in the north drift, where the calcite widened to about 30 inches, carrying smaltite and native silver.

A few days ago work was started on the new concentrator for the Silver Cliff Mine, this making the fourth concentrator that is in the course of construction. The other three are the Temiskaming, Trethewey and Nova Scotia. The mill will have a capacity of about 100 tons per day, and provisions are being made for the installation of a cyanide plant should it be found necessary. The Silver Cliff is worked from tunnels, and has a large tonnage of low grade ore in sight.

A short time ago the Cobalt Lake Mine shipped a 33-ton car of high-grade ore, which will run about 1,000 ounces. The greater portion of this car comes from the vein that was discovered a few months ago. This vein, which was found near the McKinley-Darragh, has now crossed the boundary. A crosscut is being run parallel to the line to catch two of the McKinley-Darragh veins which were worked within a few feet of the Cobalt Lake boundary. The present shipment brings their output for the year to about one hundred tons.

Several new shoots of ore have been found in the vein at the Beaver mine. Considerable work is being done on the 200 foot

level, and from this depth a winze is being sunk an additional fifty feet.

The rise in the stock of the Crown Reserve Mines, which has attracted so much attention of late, is due to the results which have been obtained from their underground workings. The main shaft has been connected with the workings of the 200-foot level, on which a large amount of development has been accomplished. This lower level is in the Keewatin formation, and although the values fell off to some extent, they still carried high values in silver. The veins are more split up, and mining operations are productive of a much larger amount of low grade ore than formerly. There is some talk of putting up a concentrator on the property.

A new vein was discovered on the Gamey lot belonging to the Cobalt Central a few days ago in a trench which is being dug by the contractors who are putting in the town waterworks system. Where discovered it was about four feet in width of calcite carrying low values in silver. No work has been done on this lot for some time.

The work on the new concentrator at the Trethewey Mine is making progress, and in a short time the cement foundations will be completed. The greater portion of the machinery has been ordered, and some of it is already on the road. The capacity of the mill will be about eighty tons a day. There is a large quantity of milling ore on the dumps and in the stopes.

Of the recent work in the main La Rose mine the most important development has been the cutting of the No. 10 vein by a crosscut running north from the MacDonald vein on the first level of the shaft. The No. 10 vein was cut at a depth of 70 feet below the tunnel level, and shows a good width of high-grade ore. Last year the vein above the tunnel level produced 200,000 ounces of silver, and also a large amount of high grade ore is blocked out. The MacDonald vein has been developed for over 300 feet below the tunnel level, and in the past has been one of the main producers of the property. At the Lawson work has been greatly hampered underground on account of the lack of power, and as soon as the air is ready for distribution, operations will be carried on on a much larger scale. The new headframe over the main shaft has been completed, and the ore house will be ready in a couple of weeks. A new shaft is being sunk on the vein found about six weeks ago near the Foster line. This vein is being sunk away from the main shaft, and will be continued to the 100-foot level. At present it has attained a depth of 35 feet. The La Rose Consolidated has been one of the heaviest shippers from the camp, and since the beginning of the year has sent out 4,500 tons. The greater portion of this tonnage comes from only one of their holdings.

On September 27th. the second cyanide plant, which is at the O'Brien mine, started treating the ore. The Moore slime process will be used, and it is estimated that an extraction of 90 per cent. can be made. When running to its full capacity, the mill will put through about 120 tons a day. The introduction of these cyanide plants in the camp is a significant step, and is being watched with a great deal of interest. Many millmen were of the impression that cyaniding could not be worked successfully, but the work recently done would seem to prove the contrary. The idea seems to be now that the cyanide process can be successfully applied for the treatment of the slimes. It is doubtful, however, if the treatment can be used to advantage with the sands. So far as can be ascertained the extraction from the slimes does not amount to over 65 per cent., and if these alone are cyanided, the process ought to be commercially successful.

Last week a deal was put through whereby the Young-O'Brien lot in the Gillies' Limit was purchased for a figure which is said to be about \$250,000. The purchase was made for a Montreal syndicate, and the property consists of seventeen acres. The value of the lot lies in the fact that the best part of the Waldman vein has been traced for a considerable dis-

tance on the surface. Outside of this but little work has been accomplished.

During the past two weeks work has been started on a large number of lots in the Gillies' Limit. The interest that has been displayed is for the most part due to the discoveries on the Waldman and Red Jacket. The shaft of the Waldman has now reached a depth of over 60 feet, and the vein in the bottom carries good values in silver. At the present time the Waldman is leasing air from the Provincial Mine, and will get its power from that source until the new owners take over the property.

A new vein carrying some silver values has been discovered at the 170-foot level of the Hylands Mines.

Progress is being made on the Nipissing Central Railway, which is to connect the towns of Cobalt, Haileybury and New Liskeard. The grading has been practically completed and the rails are being laid. The only thing that is holding up the company at present is the bridge over the T. and N. O. tracks. Some agreement will probably be reached with the railway in a few days, and when that is done the work will be rushed as rapidly as possible.

At the regular meeting of the directors of the La Rose Mining Co. the regular dividend of 3 per cent. with a 1 per cent. bonus was declared, but it is rumored that the next quarterly dividend will be on a much higher basis. The development being carried on at the Lawson property and other mines of the La Rose combination has required a great deal of money, which has come out of the La Rose treasury. In a short while, however, the Lawson will be in a position to ship continuously, and this will aid very materially in the showing made by the La Rose. The University and Princess are also in better shape than they have been for some time.

Native silver has been found in a vein on the 200-ft. level of the Shamrock Mine, which is one of the properties in South Coleman owned by the Jacobs Exploration Company. The development of this property is giving promising results, and several veins that were not located on the 100-ft. level are now being worked at the 200-ft. level. On the vein in which the silver has been found about 200 feet of work has been done. It is about 3 inches in width and carries considerable silver.

It is estimated that the new buildings being erected in Cobalt will total about 150, and have a value of nearly a quarter million dollars. The great majority of these are being erected on the Haileybury broad, that portion of the town which was wiped out by fire several months ago. The land on which these buildings are being put up is owned mainly by the Nipissing Mining Company, and on the principal streets the ground rents amount to about \$1.00 to \$1.25 per foot of frontage a month.

The shaft on the new vein at the Hargraves, which is being sunk near the Drummond boundary line is now down a depth of over 40 ft. At the 40 ft. level a drift was started and at fifteen feet from the shaft ore carrying good values in native silver was encountered.

There is considerable activity in the Miller, Everett and Le Roy Lake districts at the present time. At Everett Lake about 140 men have been employed all summer by the Everett Lake Syndicate on their holdings in that section, and altogether about 60 veins have been discovered. Several of these carried silver at the surface. One vein has been traced for over 600 feet, and averages about 10 inches wide. At Le Roy Lake the Le Roy Lake Syndicate is sinking three shafts, one of which has attained a depth of about 150 feet, and at this point some good silver values were found. A good discovery was also made on the Welch claim, where a vein carrying about 1,000 ounces in silver was located. A small force of men has been engaged in trenching for the Harman McDougall & Ross Syndicate, who own a large acreage to the east of Le Roy Lake, and several promising discoveries have been made. It is understood that during the coming winter this syndicate will carry on their

operations on a much larger scale than formerly. The wagon road from Elk Lake to Gowganda has now reached the Le Roy Lake, and this will aid very materially in opening up the district. Another concern which has been operating very largely around Miller and Everett Lakes is the German Development Co. This company owns seven claims on which they have been working all summer, and on two veins at least silver was found. It is understood that they are going to dispose of their holdings in this section. Things continue to be quiet in Gowganda, and the results on the whole have been rather disappointing. The work done, however, deserves great credit considering the great disadvantages under which the companies are labouring. The enormous price of supplies has in many cases prohibited the smaller operators from working their claims. During the coming winter, when the Elk Lake to Gowganda road will be in good shape, this section will receive a great deal more attention, as the transportation facilities will be so much better. Many good discoveries have been made this summer on the properties round Gowganda, but the district is still suffering from the effects of the boom of last winter. There is no danger of a repetition of this, however, during the coming season, and operations will be carried on in a much more conservative manner. The underground workings at the Boyd-Gordon have given very encouraging results, and several very fine veins have also been discovered on the Mann. The Blackburn, however, continues to be the best mine in the whole of this section.

Dr. Milton Hersey, who was the first man to discover silver in the Cobalt ores, has been in the camp some time examining the Pierce lots in the Gillies Limit. He has purchased a half interest in this. Dr. Hersey is much impressed with the recent discoveries in that section, and gives it as his opinion that careful prospecting will widen materially the silver bearing area from its present limits.

A good deal of interest has been centred on the Temiskaming and Hudson Bay Mining Co., which recently formed the Hudson Bay Mines Ltd. with a capital of three and a half million dollars, to take over the Coleman Township properties. At the annual meeting held recently the transfer of the properties was formally announced. The number of the directors of the company was reduced from eleven to seven, and it was also decided to erect a concentrator. The report for the fiscal year ending August 31st. showed that a total of 2,400 per cent. in dividends had been paid. This amounted to a disbursement of \$186,264.00. During the year a total of 954,000 ounces of silver was produced. Recent development on this property has given very encouraging results, and new veins have been discovered on three of the levels. It is the intention to sink a winze at a junction of two of the main veins near the Nipissing boundary on the 200-ft. or lowest level of the mine. A small force of men has been engaged in trenching on the southern lots near the Gillies Limit, and several veins have been found. During the coming winter prospect shafts will probably be sunk on some of these.

Mining operations have been commenced on the White River property, which lies to the west of the Farah. It was originally tied up in the same litigation as the Hargraves, but a short time ago a company known as the Reliance Silver Mining Co., with a capital of \$1,500,000, was formed to work it. The management is practically the same as the Hargraves. A small force of men has been engaged in surface prospecting since June, but no buildings have as yet been erected. To the west of the Kerr Lake road a vein carrying considerable smaltite has been traced for 400 feet, and on this vein a shaft will shortly be started. Several other good leads have also been located on the surface.

Underground operations at the Silver Bar have been suspended, and the men put to work trenching the surface.

The Cobalt Powder Co., with a capital of \$40,000.00, has been formed to establish a plant for the manufacture of dynamite at Martineau Bay on Lake Temiskaming. Straight dynamite will be manufactured, and the capacity of the plant will be about two tons per day.

At the meeting of the directors of the Cobalt Central, held a short time ago in New York, the quarterly dividend was passed. It is stated that the reason for doing so is that the capacity of the mill is to be increased from 80 to 120 tons per day. This will necessitate an expenditure of about thirty thousand dollars, and had the dividend been declared, the company would not have had sufficient funds on hand to make the addition. Up to date this company has paid 4 per cent., aggregating \$188,460.00.

The shaft of the Eastbourn Mine is down 116 feet, and at the 100-ft. level a station is being cut. One of the best finds in the South Lorraine district since the Keely and Wetlanffer were discovered was made a few days ago on the property known as R. L. 470, which is located about half a mile north of the Keely. The vein was found on the surface, and has now been traced for about 300 feet. In places it shows considerable silver. The formation of this claim is diabase and keewatin.

The fever situation still causes considerable uneasiness, and the epidemic does not seem to be abating to any appreciable extent. Large hospital tents have been erected on the property of the Coniagas, and the town has also put up several on the Haileybury Road. In the hospital which is under the direction of the Red Cross organization there are at present about 170 patients. Besides these there are a large number in various parts of the town, and in the town hospital. Large numbers have also left the town for hospitals down the line.

#### BRITISH COLUMBIA.

**Roseland.**—More or less activity is displayed about the Le Roi mine just now, there being seventy or eighty men in all working about the property. The diamond drill exploration is going ahead as fast as three machines can drive the holes and there is considerable other work being done, including a little stoping. It has been stated that when the storage space at the mine has been filled with the ore brought to the surface, it is likely that shipments will be made. If this is done it will be almost sure in a short while to lead up to the operation of a part of the company's smelting plant at Northport.

There is so much work going on at the Centre Star group of the Consolidated Co. that only the most important of it attracts any attention. On the Enterprise claim of the group a few days ago a body of good-looking ore was pierced by the diamond drill at a depth of approximately one hundred feet. The diamond drill work is to be continued on the property of the company in that section for some time before work of a more permanent and expensive character is undertaken. Another good body of ore was recently opened up below the 1600-foot level of the Centre Star mine and this is now being approached by a winze for the purpose of more thoroughly working it. The Company's shipments are averaging 3,900 to 4,000 tons per week to the Trail smelter right along. While it is not likely these shipments will be decreased any, yet they will not be increased much until a better price for copper prevails.

The shaft on the Josie property of the Le Roi 2, Ltd., is now down to the 1,120 ft. level, having been sunk 220 feet since the work was started about July 1st. The company is not shipping very heavily, although fair shipments are being maintained. Considerable good ore has been located in the deeper workings which the new shaft will open up and when this ore is available and the extra work off its hands it is thought the company will augment its ore shipments to quite an extent.

A five-drill compressor has been put in and started to work at the Inland Empire mine. The shaft is to be deepened from the 225 ft. to the 375 ft. level.

**The Boundary.**—While the plans of the British Columbia Copper-New Dominion relations have been somewhat slow in unfolding, still things are gradually coming to a focus. The fortunes of these two companies have been drawn so closely together by recent events that it does not seem amiss to link their names together, especially when it is known that plans are under way for a merger. One thing seems to have been settled and that is that the mines of the New Dominion Copper Co. are to be worked at an early date and that the product of these mines will be smelted and converted to blister copper at the smelter of the B. C. Copper Co. at Greenwood. This, of course, will mean the enlarging of the B. C. Copper Co. smelter, for with the plans that this concern has in view for its own interests, all or more than all of its present smelter capacity would very likely have been used. While it would be preferable, no doubt, to some of the men interested, to see the Dominion Copper smelter at work, still, there are times when corporations, like individuals, have to make the best of a bad state of affairs, and this is what the New Dominion Co. has got to do today. The Boundary Falls smelter is a white elephant on its hands, on which the interest on investment, depreciation, and other fixed charges are quite heavy, but little or nothing would be gained by starting work there under present conditions, while on the other hand there would be a loss on the ore treated, when compared with the treatment rate that can be secured from the B. C. Copper Co., which company has always had to convert the Dominion copper matte, anyway, as well as marketing it, the charge therefor being about three cents per pound. In passing it might be of interest to state that in order that a profit be made from New Dominion ore at present figures, the mining costs will have to be kept under \$1.25 per ton; smelting charges approximately \$1.35; converting, refining and selling at under 50c per ton, or a total of \$3.10. The result of these figures would be eleven or twelve cent copper, and when it is known that the B. C. Copper Co. is making copper at present at from nine to ten cents, it may be seen that under normal conditions a profit of 40c to 45c per ton should be made on the ore from the above mentioned mines.

Among other recent acquirements the B. C. Copper Co. has taken a bond on seven or eight groups of mineral claims in the Kamloops mining district; these comprise in all about thirty-three claims. Among the different properties acquired may be named the Bonanza group, Kimberley, Rising Sun, Giantess, Laura, Maxim, Esperanza, etc. This is an important move for Kamloops camp, for if the diamond drill work which the Copper Co. is about to do results satisfactorily, then there is a good likelihood of the Kamloops smelter question being settled by the establishment of such a plant.

It is said that the entire capitalization of the New Dominion Copper Co., 250,000 shares of a par value of \$5, has been issued, and in addition there will be outstanding some \$500,000 in bonds. This should place the company in a splendid condition, financially. The dissenting shareholders are still hammering away at their forlorn hope and have now secured an order from the courts for an examination of the books of the old Dominion Copper Co., intimating that it is their belief that the old company was deliberately wrecked. One of the Vancouver account-

ing firms is now working on the books at the Company's mine offices.

It is claimed that the B. C. Copper Co. is holding nearly two million pounds of copper for better prices. Some of the local mining men, however, do not look for a very great rise in copper for some time to come; for, even should the price strengthen a little there are many of the big producers ready to almost double their outputs, which would soon flood the market again, and lower the price.

**Nelson District.**—Preparations are now under way for the re-opening, on a substantial scale, of the Slocan Star mine, which has been trammelled for some years past by a costly litigation. A new and rich ore body was not long ago opened up on the property.

It is also rumored that the Sullivan group of lead-zinc mines, near Kimberley, will be opened up again soon. This is one of the largest properties in the Kootenay district of its kind. It is very probable that the smelter will also be gone over and put into operation. The whole property was recently acquired by the Fort Steel Mining and Smelting Co., said to be a subsidiary company to the Federal Mining and Smelting Co., of the United States, which company held a majority of the bonds of the old Sullivan company.

Shipments of ore and concentrates from the Highland-Buckeye property continue at the rate of about 25 tons per week. The shipments will be considerably increased as soon as the new air compressing and rock drilling plant has been installed.

Work at the Mother Lode and Yankee Girl mines, Sheep Creek and Ymir districts have reached a stage where an increase of plant is necessary and it is likely that such plants will be installed in the near future and the shipments from the mines increased. The same may be said of the Fife Mines, near Fife, B.C. Things are very active with the smaller mines and the outlook is promising.

**Vancouver.**—A new concern has been organized in Victoria for the taking up and developing of promising mineral prospects. This company will be known as the Pacific Metals Co., with a capital of \$250,000. W. M. Brewer, who recently resigned from the service of the Tyee Copper Co., is president; J. L. Parker, manager.

Those who have their eyes on the Portland Canal mining district are predicting busy times for the mines there. The Portland Canal Mining Co. is getting in its tramway and concentrator and may soon be ordering further additions to its plant. The Red Cliffe Co. is also preparing for an active campaign. Properties recently bonded include the Victor, Ajax, Ben Bolt, the McKay and other mineral claims. The figures for the Ajax and Ben Bolt were over \$100,000, while it is stated that big prices were paid for the other claims named.

The engineers of the Short Line Railway of Portland Canal are on the ground running their surveys.

All arrangements have been made for the opening up of the coal property of the Vermillion Forks Mining and Development Co. at Princeton. Mr. Charles Graham has arrived on the ground to superintend the work. Among other things a new tipple is to be constructed.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Halifax, N.S., Oct. 9.**—The Dominion Coal Company now has ten collieries producing, No. 4 being the latest addition. This is one of the new collieries in the Victoria Langan district. The average output of 8,000 tons a day is now being easily maintained.

A large number of workmen from Newfoundland reached Glace Bay yesterday. Twenty-five expert Bohemian long-wall miners arrived yesterday at Reserve Mines, where they will be employed in the Emery seam. Other experienced men are coming every day.

About one hundred and seventy-five eviction cases have been

heard before Judge Finlayson since the beginning of the strike. Judgment in favour of the company has been given in about one hundred and fifteen cases. About thirty-five cases have been won by the men. In the remainder judgment has been reserved.

The output yesterday was a few tons over 9,000, and Thursday the output was 8,256 tons.

#### QUEBEC.

Sherbrooke, Que., Oct. 8.—(Special.)—Mining property and plant of Asbestos Mining and Manufacturing Company in liquidation in county of Wolfe, was sold by auction yesterday to E. Florence, of Providence, R.I., for \$55,000.

#### ONTARIO.

Sudbury.—The Scadding mine, east side of Wahnapiatae Lake, has been pumped out and sampled by a mining engineer of excellent reputation. The results are understood to be encouraging and further development will be undertaken. The drawback to the property is its inaccessibility. If the railway for which some townsmen applied for a charter were constructed large shipments from this and other mines along the projected line, would now have been yielding business and prosperity to this district.

The Dominion Nickel Copper Co., Limited, has a force of about 100 men at work putting in a spur line from the Canadian Northern Railway to its nickel property. The spur will be about four miles in length.

Cobalt.—The Cobalt Station Mining Company has made arrangements with the T. and N. O. Railway Commission whereby the company will be permitted to sink two shafts in the property. All difficulties as to railway track space have been smoothed away. It is proposed to sink each shaft 100 feet and then drift on to the veins.

Sault Ste. Marie.—The Bessemer, open-hearth, blooming, and rail-mills of the Algoma Steel Company opened on Monday, Oct. 4th.

Port Arthur.—Mr. J. Dix Fraser, general manager of the Atikokan Iron Co., states that there is an excellent market for their pig iron. Mr. Fraser expects to ship about 7,000 tons before navigation closes.

#### BRITISH COLUMBIA.

Sheep Creek.—An important strike is announced from the Nugget mine. A four foot vein has been encountered on the fourth level.

Greenwood.—The B. C. Copper Company blew in its third furnace on September 30th. This brings its total smelter capacity up to about 2,000 tons per day. The Oro Denord mine has resumed shipments.

Vancouver.—During the visit of the Hon. Mr. Templeman to Vancouver, late in September, he was waited upon by a delegation consisting of Messrs. Irving, Pratt and Whittier, representing the zinc industry of the province. It was suggested that tests of zinc-bearing ores be made under government auspices. The Minister promised to present the case to his colleagues at Ottawa.

## MINING NEWS OF THE WORLD.

#### GREAT BRITAIN.

In answer to an interrogation from a member, Mr. Lloyd-George asserted recently that the new mineral taxes will apply to clay used in the manufacture of bricks.

In the opinion of the London and West Country Chamber of mines, the new tax on mining royalties will tend to discourage Cornish mining. The new burden will fall, it is believed, not upon the landlords, but upon the parties working the mines.

At the colliery of the Lochgelly Iron and Coal Company, near Dunfermline, Scotland, a sudden inrush of water from an old working imperilled the lives of 300 miners. No lives were lost.

#### EUROPE.

##### Austria.

Vienna.—The Minister of Public Works has received from the mines at Sankt Joachimstal ten grammes of radium. This is the entire output over a period of eighteen months. Its money value is placed in the thousands of pounds.

It appears that the various zinc concerns making up the proposed new European zinc trust are arranged into two principal groups. The first group comprises 18 concerns, principally the zinc works of Upper Silesia and Westphalia, certain Austrian concerns, and several Belgian works. This group is organized as a German company designated as Zinc Hussen Verband. In

Silesia the Heritier George van Geische Company has remained outside the syndicate, although in many ways closely associated with it. The production of the first group has been limited for 1909 to 255,086 metric tons, and for 1910 to 264,232 metric tons. The second group comprises the zinc works mainly located in Belgium, notably the Vielle Montagne Company. The production for this group is limited for 1909 to 174,519 metric tons, and for 1910 to 175,919 metric tons.

##### Turkey.

The Ministry of Agriculture, Mines and Forests at Constantinople has decided to entrust to private enterprise the further exploitation of the Arghana copper mines in the Vilayet of Diarbekir. A concession for the term of sixty years will be granted for this purpose to an Ottoman company, which is prepared to undertake the mining and reduction of the ore and the transportation and sale of the copper extracted. Smelting works will have to be built on the plateau of Arghana Sou (sources of the Tigris), about 1½ miles from the principal mines. Sufficient capital is required for putting the mines in better working order and for needed smelters and for the generation of electric power from the waterfalls. The company must be in a position to exploit the mines to the fullest advantage, according to the latest improved methods, so as to cover also lower-grade ores hitherto neglected. The Government leaves the disposal of the output altogether to the company, but reserves to itself the prior right to enough copper to satisfy its own needs, for which it will pay at current prices. Certain rebates having been allowed, the net

profit is to be divided between the Government and the company. Every applicant must deposit the sum of \$12,000 as a token of good faith. All deposits will be returned except to the concern which secures the concession and which is governed by special stipulations. Proper evidence of the applicants' financial responsibility must be filed with the applications. On its part the Government pledges itself to facilitate the operations of the company. The latter obtains, free of cost, the use of the necessary lands and waters. With the exception of the higher personnel (managers, engineers, clerks, etc.), the employees must be Ottoman subjects, and the Government, as a silent partner, retains the necessary measure of control of the management of the business. Applications will be received by the Ministry, in sealed envelopes, up to April 15, 1910. This delay will enable interested parties to visit and examine the mines in person.

#### AFRICA.

##### South Africa.

Johannesburg.—The Coal Association has tendered the rock-bottom price of 3s 6d per ton for supply to the Cape Railways, as an act of reprisal against the Witbank Colliery for declining to join the combine against competition.

The Roberts Victor Diamond Company has just accomplished a record in sinking, 267 feet having been sunk in a month in the new shaft now being put down outside the mine to reach the blue ground, which will enable the mine to be worked on a much larger scale.

The Transvaal Consolidated Land Company made a profit of £8,000 for August out of its Groenfontein tin mine in the Waterberg district. It is contemplated erecting additional plant, when the profits are estimated to reach £25,000 monthly.

Mr. Sam Evans, chairman of the New Modderfontein Gold Mining Company, at the annual meeting stated that companies crushing over 40,000 tons a month were able to operate at 7s 7d per ton less than those crushing below 10,000 tons a month. This is certainly a strong point in favour of the large amalgamations which are at present so popular on the Rand. The pioneer in these amalgamations was the East Rand Proprietary, whose results since amalgamation have fully justified the adoption of his plan. It will be recollected that, prior to amalgamation, the Comet, Driefontein, Angelo and Cason gave at one time or another very variable returns, but the advantage of amalgamation provides against these fluctuations by permitting ore to be drawn from any of the mines when a poor zone is encountered. This holds good in all the other amalgamations, and will give a steadiness to profits otherwise unattainable. For instance, the Robinson Deep is at present in one of these poor zones, due to its being unable to raise ore from the richer section of the mine in the dip of the Robinson Central Deep. An amalgamation in his case with the Booysen's Estate, at present being discussed, would strengthen the Robinson Deep Company, and make for better returns and profits.

##### Nigeria.

The Nigeria Bitumen Corporation, Limited, operating in the Lagos Colony, British West Africa, has struck oil in large quantities. On borehole No. 5, water has broken in. But no permanent harm has been wrought. The discovery has caused quite a stir in London.

#### AUSTRALIA.

For the quarter ending June 30th, 1909, Queensland produced tungsten concentrates to the value of £7,042, and molybdenite worth £1,892.

#### INDIA.

U. S. Vice-Consul-General Charles B. Perry, of Calcutta, reports that while manganese is one of the advancing industries of India, the trade has received a setback, the quantity exported falling from 42,570 tons in fiscal year 1907-8 to 24,968 tons in 1908-9, while the value declined from \$254,329 to \$156,763. These results are believed to be due to a revival of the Russian manganese industry, which had received a severe check owing to the troubles in that country. The exports to the United Kingdom in 1908-9 were less than one-half those of the preceding year, those to Holland ceased altogether, while those to Belgium, however, increased. The United States took only a small quantity of the ore, but even then it was an increase on that taken in 1907-8.

#### UNITED STATES.

##### Pennsylvania.

The proposed merger of independent coking interests of the Connellsville region has been abandoned for the present. If the capital for backing the merger had been ready when the announcement of the plans was made and the plans had been hurried it is believed it would have been formed. As at first proposed, the merger would have required \$60,000,000. It was proposed to take over the holdings on a cash basis, but this later was abandoned and a proposition was made to the operators to accept part cash and the remainder in stocks and bonds. The latter proposition was not well received. Companies that would have sold on a cash basis refused to consider the other proposition. Coke now commands from 50 to 75 per cent. more than it did last spring when the consolidation movement was started, and the demand is constantly increasing, as is also the production.

##### Alaska.

Nome.—Although the season of 1909 has been one of the driest on record, the shipments of placer gold from Nome will fall not more than 30 per cent. below those for 1908. Shipments during the spring were heavy; but scarcity of water in the ditches and streams traversing the gravel slopes south and east of the Kigluik Mountains has cut down the output for the remainder of the season.

## Company Notes.

The annual report of the Granby Mining, Smelting & Power Company, Limited, for the year ended June 30th. shows net profits of \$681,135, an increase over 1908 of \$74,613.

The payment of dividends and bonuses to employees totalling \$270,000, left a balance of \$411,135, which compares with last year's deficit of \$91,578, the item of dividends and bonuses in that year having been \$502,713 in excess of those paid this year. There was charged \$167,628 for interest, depreciation, etc., \$61,371 less than last year, leaving a surplus of \$243,507. This, added to the previous surplus of \$2,455,181, left a total surplus of \$2,698,688.

The prices realized for both copper and silver were smaller than in the previous year, copper bringing 13.22 cents per pound on the average, as compared with 13.33, and silver 51.25 cents per ounce, as against 56.25 last year.

The annual report of the Kerr Lake Mining Company for the year ending on August 31st. shows a total income of \$1,386,544, against \$790,484 last year, an increase of \$596,000.

The total net surplus is \$1,129,047, against \$484,537.

The total production of silver was 2,668,648 ounces produced from 1,072 tons of ore (average contents per ton 2,489 ounces) and 600,000 pounds of skimmings. The gross value of this production is, at 50c an ounce, \$1,334,324.

The report says that the amount of cash on hand, together with the ore shipped and unsettled for, is sufficient to pay dividends for the coming year, and that the company's ore reserve will insure dividends at the present rate for a number of years.

#### BRITISH COLUMBIA SYNDICATE.

The report of the British Columbia (Rossland and Slocan) Syndicate, Ltd., for the year 1908, to be presented at the meeting on 5th. proximo, states that the mining claims and other interests held by the company remain about the same as at 31st. December, 1907. The company retains its holding of approximately two-thirds of the issued capital of Snowshoe Gold and Copper Mines, Ltd., and it is hoped that during 1910 that company will be entirely freed from liability and its shares be a profitable

asset of this company. Work on the Snowshoe mine was resumed in September, 1903, and continuous shipments of some 11,000 tons per month have been made since that date, fair profits being earned. The directors have carried on negotiations with various parties with a view to making satisfactory arrangements for the reopening of the Velvet-Portland property, upon which this company has a debenture and option of purchase, but so far it has not been possible to bring these to a satisfactory issue. Negotiations are, however, still in progress in another source. The accounts show an increase of £1,163 in the debit balance on profit and loss account after allowing for interest on bank loan, taxes on properties and other expenses in London and British Columbia.

#### RIGHT-OF-WAY DIVIDEND.

A quarterly dividend of 6 per cent. for the three months ending September 30th, has been declared on the stock of the Right of Way Mining Company. The dividend is payable to holders of record of September 25, and will be paid October 1st. Book closed from Sept. 27 to 30 inclusive.

## STATISTICS AND RETURNS.

#### COBALT ORE SHIPMENTS.

Following are the shipments from the Cobalt Camp for the week ending Sept. 25, and those from Jan. 1, 1909, to date:

|                    | Sept. 25. Since Jan. 1. |             |
|--------------------|-------------------------|-------------|
|                    | Ore in lbs.             | Ore in lbs. |
| Buffalo            | 57,110                  | 889,778     |
| Carnegie           | 63,410                  | 63,410      |
| Chambers - Ferland | 961,010                 | 961,010     |
| City of Cobalt     | 1,042,522               | 1,042,522   |
| Cobalt Central     | 40,610                  | 640,754     |
| Cobalt Lake        | 61,380                  | 141,340     |
| Coniagas           | 62,530                  | 1,216,015   |
| Crown Reserve      | 187,300                 | 4,683,379   |
| Drummond           | 992,100                 | 992,100     |
| Foster             | .....                   | .....       |
| Kerr Lake          | 62,020                  | 1,704,226   |
| King Edward        | 183,740                 | 183,740     |
| La Rose            | 195,010                 | 9,363,443   |
| Little Nipissing   | .....                   | .....       |
| McKinley Dar.      | 86,140                  | 1,512,246   |
| Nipissing          | 62,430                  | 9,865,783   |
| Nova Scotia        | 480,810                 | 480,810     |

## DOMINION COAL.

The Dominion Coal Company's output is increasing steadily. The figures for the past three months are:

|                 |         |
|-----------------|---------|
| September ..... | 188,500 |
| August .....    | 153,908 |
| July .....      | 135,604 |

The strike began on July 6th.

Returns to the Bureau of Mines show the output of the metalliferous mines and works of Ontario for the six months ending 30th. June, 1909, to have been as follows:

|                      | Quantity.  | Value.    |
|----------------------|------------|-----------|
| Arsenic, tons .....  | 1,517      | \$ 28,320 |
| Gold, ounces .....   | 741        | 14,011    |
| Silver, ounces ..... | 11,234,382 | 5,379,980 |
| Cobalt, tons .....   | 263        | 46,117    |
| Copper, tons .....   | 3,741      | 529,775   |
| Nickel, tons .....   | 6,027      | 1,234,620 |
| Iron ore, tons ..... | 87,738     | 217,341   |
| Pig iron, tons ..... | 211,583    | 3,197,759 |
| Zinc ore, tons ..... | 200        | 2,000     |

The total value of the production was \$10,649,923, as against \$8,082,264 for the first six months of 1908.

There were shipped from the silver mines of Cobalt during the above period, 15,360 tons of ore, including concentrates, as against 9,209 tons in the same period of 1908. The increase in the quantity of silver contents being about 45 per cent. Nickel increased 26 per cent. in quantity and pig iron 44 per cent. Iron ore remained about the same, and there was a slight decrease in copper.

The Consolidated Mining and Smelting Company of Canada, Ltd., ore receipts at Trail smelter for week ending September 18th. and year to date in tons.

|                                 | Week. | Year.<br>to date |
|---------------------------------|-------|------------------|
| Company's Mines—                |       |                  |
| Centre Star .....               | 3,022 | 121,335          |
| St. Eugene (concentrates) ..... | 353   | 16,402           |
| Snowshoe .....                  | 4,366 | 99,295           |

### TORONTO MARKETS.

#### Metals.

Oct. 7.—(Quotations from Canada Metal Co., Toronto.)  
 Spelter, 5¼ to 6 cents per lb. (stronger).  
 Lead, 3.75 cents per lb.  
 Antimony, 8½ to 9½ cents per lb.  
 Tin, 32 cents per lb.  
 Copper, casting, 13¾ cents per lb.  
 Electrolytic, 13.75 cents per lb.  
 Ingot brass, 9 to 12 cents per lb. (metal market very strong).  
 Oct 7.—Pig Iron (quotations from Drummond, McCall Co.).  
 Summerlee, No. 1, \$24.00 (f.o.b. Toronto).  
 Summerlee, No. 2, \$23.50 (f.o.b. Toronto).  
 Midland, No. 1, \$22.50 (f.o.b. Toronto).  
 Coal, anthracite, \$5.50 to \$6.75.  
 Bituminous, \$3.50 to \$4.50 for 1¼ lump.

#### Coke.

Oct. 5.—Connellsville coke (f.o.b. ovens).  
 Furnace coke, prompt, \$2.75 to \$2.85 per ton.  
 Foundry coke, prompt, \$2.50 to \$2.75 per ton.  
 Oct. 5.—Tin (Straits), 30.70 cents.  
 Copper, prime Lake, 13.00 to 13.10 cents.  
 Electrolytic copper, 12.90 to 13.00 cents.  
 Copper wire, 14.50 cents.  
 Lead, 4.37½ to 4.40 cents.  
 Spelter, 5.90 to 5.95 cents.  
 Sheet zinc, 8.00 cents.  
 Antimony, Cookson's, 8.50 cents.  
 Aluminium, 23.00 to 24.00 cents.  
 Nickel, 40.00 to 49.00 cents.  
 Platinum, \$26.50 to \$30.25 per oz.  
 Bismuth, \$1.75 per lb.  
 Quicksilver, \$43.00 to \$44.00 per 75-lb. flask.

### MARKET NOTES.

In a circular, dated October 1st, D. Houston & Co., N.Y., have this to say concerning the copper market:—

"The supply and demand problem as it relates to copper is a complex and far-reaching one. The hope for market improvement does not lie so much in the curtailment of output as in an expansion of demand. The modern mining and smelter equipments contemplate operations at high pressure, and if demand lags it must be stimulated by every means possible until it equals production and licks up the surplus stocks. The law of the land, the law of economics, and the necessity of keeping the full complement of labour constantly employed all stand in the way of reducing output. The sensible plan would be to let the development of new properties wait until they are needed. As for the copper mining properties now in the field the world must regard them as permanent factors while ore lasts, organized and equipped to produce up to their capacity irrespective of manufacturing requirements. Shut-downs at mines are expensive remedies, being followed by depreciation of machinery, disorganization of labour forces, and a loss of revenue too heavy for any probable immediate compensating gains likely to accrue. Partial restriction of production also has its drawbacks owing to the increased cost of turning out a smaller product. With the remarkable activity in iron, and the flood of orders pouring into the steel companies, demand for copper will eventually broaden out greatly in a way that will perhaps surprise the entire trade. Copper will yet come in for its full share of the industrial and business prosperity to which the country is looking forward."

# Mining Companies

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing, and distributing Annual Statements, Special Reports, Descriptive Pamphlets, Prospectuses, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction. We are making a specialty of engraving and printing bonds, stock certificates, professional and business stationery, business cards and all such work. Orders from mining districts will receive prompt attention.

We shall be glad to furnish estimates to enquirers.

Confederation Life Building

Toronto, Ont.

Now Ready

## Richard's Ore Dressing

Volumes III and IV

Per Volume \$5.00 [21s] Net Postpaid

The Set, 4 Volumes, \$20.00 [£4 4s] Net Postpaid

NOTICE—The index for all four volumes will be issued separately and supplied free at an early date to all purchasers of Volumes III and IV.

It required two large volumes to cover the new machinery, processes, discoveries and data in ore dressing. These volumes supplement but do NOT SUPPLANT I and II.

In general arrangement Volumes III and IV are similar to Volumes I and II. The Chapters are each intended to supplement the subject-matter of the corresponding chapters in the earlier volumes, describing new machines, new processes, and giving new data. The greatest care has been exercised in avoiding repetition.

Since the issue of the earlier volumes, many important discoveries have been made and radical departures introduced in established processes. Volume III, for example, has complete discussions of fine grinders, particularly the tube mill and grinding pans, rectilinear tables of the Wilfley type, the questions of magnetic separation, electrostatic separation, the flotation processes, and other subjects of like importance not covered in the earlier volume.

When Volume I was issued, the tube mill, which has almost revolutionized gold and silver milling practice, was

hardly touched upon. The Wilfley table was just finding its place among mills, and a number of other tables of the same type have been developed since.

Volume IV describes in detail some 94 complete mills, showing the most approved modern and successful methods of applying ore-dressing principles in use to-day throughout the mining districts of the world. Comparisons are made with earlier descriptions to show modifications and improvements, and to point out errors in older plants.

Throughout both volumes, much space and great care have been devoted to the general subjects of costs of operation, speed, capacity, water power, life of machines, etc. Power and water plants are described in connection with nearly every mill.

Complete Bibliographies are added. The Index for the entire four volumes has been remade and will be bound separately. It will be furnished without charge to purchasers of Volumes III and IV.

Book Dept. Canadian Mining Journal - Toronto

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

**CANADA.—DEPARTMENT OF MINES.**

# Geological Survey

## **PUBLICATIONS**

The Geological Survey has published maps and reports dealing with a large part of Canada and with many local areas and special subjects

### **MARITIME PROVINCES**

The whole of Cape Breton and a large portion of the coal and gold fields of Nova Scotia have been reported upon and mapped on a scale of 1 mile to 1 inch. The remaining portions of the province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter provinces, mapped on a scale of 4 miles to 1 inch.

### **QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the province north of the St. Lawrence are also available.

### **ONTARIO**

A large part of the province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

### **THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the provinces of Manitoba, Saskatchewan and Alberta.

### **BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the province, have been reported upon and mapped.

### **YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

### **THE NORTH-WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of a report or map will be sent to Canadian applicants free of cost and to others at cost of publication.

A complete list of publications will be sent free to any applicant.

*Applications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

### **THE FOLLOWING GEOLOGICAL MAPS HAVE RECENTLY BEEN ISSUED:**

#### **NOVA SCOTIA**

- 1019 City of Halifax Sheet.  
1025. Waverley Sheet.

The above two sheets belong to the regular series of Nova Scotia map sheets on a scale of one mile to one inch. The first includes Halifax City and Harbour, the second the Waverley Gold District.

#### **ONTARIO**

1076. Gowganda Mining Division.

This map besides representing the geology of the Gowganda area, represents the geography of a considerable area to the east and north.

#### **BRITISH COLUMBIA**

1002. Geological Sheet, Special Map of Rossland.

This map, on a scale of 400 feet to 1 inch, besides accurately indicating the topographical and cultural features, shews the geology and location of veins.

1074. Sketch map of Sheep Creek Mining Camp, West Kootenay, B.C., scale 1 mile to 1 inch, by W. H. Boyd.

NOTE.—Maps recently published may be had on linen cloth for use in the field at the price of 10c. per copy.

### **REPORTS**

1072. Summary Report of the Operations of the Geological Survey for year 1908.

The Geological Survey, under certain limitations, will give information and advice upon subjects relating to general and economic geology. Mineral specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

*Communications should be addressed to THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA.*

*When answering Advertisements please mention THE CANADIAN MINING JOURNAL.*

## University of Toronto

### FACULTY OF APPLIED SCIENCE AND ENGINEERING

#### Courses in

1. Civil Engineering.
2. Mining Engineering.
3. Mechanical and Electrical Engineering.
4. Architecture.
5. Analytical and Applied Chemistry.
6. Chemical Engineering.

Diploma granted at the end of three year  
B. A. Sc. at the end of one additional year.

#### Professional Degrees:

Civil Engineer (C. E.)  
Mining Engineer (M. E.)  
Mechanical Engineer (M. E.)  
Electrical Engineer (E. E.)  
Chemical Engineer (C.E.)

For Calendar and other information apply to the  
Secretary

# Ontario's Mining Lands

---

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The chief minerals of the Province of Quebec are : Asbestos, Chromite, Copper, Iron, Gold, Silver, Phosphate, Mica, Plumbago, etc ; ornamental and building materials etc.

The Mining Law gives absolute security of title and aid to the prospector. It may be summarized as follows :

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

With the exception of lands already disposed of, the whole Province, in surveyed and unsurveyed territory, is open to prospecting.

**Miners' Certificates** good for a calendar year may be obtained by sending \$10.00 to the Department of Mines. Such certificates give the holder the privilege of staking out by himself claims to the extent of 200 acres, the minimum being 40 acres in unsurveyed land and one lot on surveyed Crown Lands, and part of a lot on private lands.

Such claim is valid for four months, without payment of any fee, and, within that time, the claim may be leased under a mining license, on payment of a fee of \$10.00 plus a yearly rental of \$1.00 per annum. No inspection of the discovery or assessment work is required.

The claim on unsurveyed land or the lot in surveyed

territory may be purchased as a mining concession at the price of \$20.00 per acre if within 20 miles of a railway in a straight line, or \$10.00 if the distance is greater, and by fulfilling certain conditions mentioned in the law.

When the mines leased or sold are situated on private property, the land may be expropriated if the surface owner refuses to come to an amicable settlement with the holder of the mining rights.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which discoveries of minerals have been made, and through which the new Transcontinental railway will run.

Special arrangements have been made with Mr. Milton L. Hersey, 171 St. James Street, Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners, and prospectors in the Province of Quebec.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the Province, and will supply maps, reports, copies of the law, tariff of assays, etc, to all who apply for the same.

All communications, letters and money must be addressed to

**The Hon. Minister of Colonization, Mines and Fisheries  
Quebec.**

## Province of Nova Scotia

**Leases for Mines of Gold, Silver  
Coal, Iron, Copper, Lead, Tin  
AND  
PRECIOUS STONES**

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver; \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals; or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,039 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

## The Crow's Nest Pass Coal Co. LIMITED

### OFFICES

**Manning Arcade, Toronto**  
**Fernie, British Columbia**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

### Our Analyses Speak for Themselves.

**CHAS. SIMISTER,**  
General Superintendent.

**J. D. HURD,**  
General Manager.

## WHY IS IT

THAT SALES OF

**MORTON'S**

**" B C "**

## Drill Steel

ARE INCREASING EVERY DAY?

MUST BE IT IS BETTER MATERIAL,

**Gives Best Satisfaction**

AND THE DRILL

**Lasts Longer.**

**D. W. CLARK, P.O., Box 521, Toronto.**

## The Longest Continuous Double Track Railway in the World Under One Management.

### The Great Double Track Route Through Canada.

Fast passenger service from the Atlantic Ocean to the head of the Great Lakes. The line taps all the principal commercial centres in Canada and reaches the important points in the States of Maine, New Hampshire and Vermont, the principal towns and cities in the Provinces of Quebec and Ontario, and many important places in the States of Michigan, Indiana and Illinois.

## The "International Limited" (Canada's Railway Greyhound)

### The Finest and Fastest Train in the Dominion

Runs every day in the year leaving Montreal at 9.00 o'clock in the morning for Toronto, Hamilton, Niagara Falls, Buffalo, Detroit, Chicago and intermediate points.

Write for copy of "Trains 3 and 4" descriptive of the route from Chicago to the sea, to J. Quinlan, Bonaventure Station, Montreal, or to J. D. McDonald, Union Station, Toronto.

# MONTREAL STEEL WORKS, LIMITED,

P.O. BOX  
2369 Montreal

Manufacturers of

**Steel Castings**

(Acid Open Hearth System)

**Switches and Track Work**  
for Steam and Electric Roads

**Springs**

of all kinds

**Manganese Steel Castings**

for wearing Parts, insuring Great  
Hardness and Durability

**INTERLOCKING PLANTS**  
**TRUCKS FOR ELECTRIC CARS**

AGENTS FOR CANADA FOR

**THOS. FIRTH & SONS, LIMITED, SHEFFIELD, ENGLAND**

"Speedicut" High Speed Steel, Tool Steel, Axe Steel, Saw Steel, Files, etc. A large stock carried in our warehouse

**BARROW HAEMATITE STEEL CO., BARROW-IN-FURNESS, ENGLAND**

Quotations for Tee Rails, Fish Plates, etc., promptly furnished. Catalogues sent on application.

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

**General Passenger Department, Intercolonial Railway**  
**MONCTON, N.B.**

# Westinghouse Motors for Mines

Westinghouse Mine Motors are noted for great strength of parts, large self-oiling bearings that seldom need attention, large overload capacity, low operating temperature and high efficiency.

We illustrate a Westinghouse Induction Motor driving a Deep Mine Sinking Pump. Westinghouse Alternating and Direct Current Motors are fully described in Circulars 1068 and 1118; ask for copies.

## Canadian Westinghouse Co., Limited

General Office and Works, HAMILTON, ONTARIO.

Traders Bank Bldg.,  
TORONTO.

439 Pender Street,  
VANCOUVER.

Address nearest office:  
HAMILTON.

922-923 Union Bank Bldg.,  
WINNIPEG.

252 St. James Street,  
MONTREAL.

158 Granville Street,  
HALIFAX.

# HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other Accessories.

### NOBEL GELIGNITE

It always breaks cleanly to the bottom of the drill holes and is free from fumes of any kind. Equal to 75% Dynamite and is sold at a price producing very much better results in terms of Rock Broken or Extracted and money spent.

### "WINTER BRAND" DYNAMITE

Is only one strength, if anything, a little stronger than 50% Dynamite. It does not freeze, or rather, explodes with perfect efficiency when frozen and needs no thawing.

### "AUTUMN BRAND" DYNAMITE

Is packed in all the usual percentages. The powder is similar in appearance, character and effect to ordinary Dynamite, except that the freezing temperature of the Nitro-Glycerine is reduced from 42° F to a little under 30° F.

### PERMITTED EXPLOSIVES for Coal Mines

Nobel Monobel, Saxonite and Carbonite.

## CLEVELAND STOPE DRILLS

85 % of the stopes run with power drills in Cobalt within the last two years have been done with "Cleveland" Stoppers—WHY? Because the Superintendents there have found that they will do more work at a lower cost than any other.

Other camps in Eastern and Western Canada are approaching this same average, and judging from past experience we know that if you will give them a trial you will be added to our list of customers.

There's a reason why the "Cleveland" is the best, but you must see and try one in order that you may appreciate the many exclusive features embodied in its design.

## Underwood

A contest for the typewriting championship of the world was held in New York on September, 30th.

It was won by Miss Rose L. Fritz, the famous Underwood operator, who wrote 172 words a minute for one hour.

The Underwood has won the world's championship in thirteen successive contests. It has won every other contest of importance in recent years.

Contests subject a machine to the severest strain. The logical deduction is that the Underwood is a good typewriter.

## Amatite ROOFING

All you need  
is a  
- hammer -  
you'll never  
need a  
paint brush

lay it right over the old roofing. It will cost you less than the continued maintenance of the old roof.

The point to remember is that *you will never need a paint brush* if you buy Amatite roofing. All you need is a hammer, because we supply free nails and liquid cement to finish the job.

Send for free sample of Amatite and you will at once see why it never needs to be painted and why it is more durable and lasting than any other.

Write to-day to nearest office.

When you lay Amatite on the roof you're through with it. You don't have to paint it every year or two to keep it from leaking. It has a *real mineral* surface which does not need painting.

Next time you are due to paint your old roofing, just let it go till the roof is worn out and then get Amatite and

## THE PROCEEDINGS OF THE SELECT STANDING COMMITTEE OF THE HOUSE OF COMMONS ON MINES AND MINERALS.

Last winter a Select Standing Committee, composed of twenty-five members of the House of Commons, was appointed "to examine and inquire into all such matters and things as may be referred to it by the House; and report from time to time its observations and opinions thereon."

The appointment of the Committee was a compromise. Urgent requests from the Canadian Mining Institute for a Royal Commission had been put before the Government. There is little doubt that these requests would have been granted had mining interests sufficient representation in the House. As it was, the Government could not see its way clear to appoint a Royal Commission, largely, we believe, because of the outlay of money that would be entailed. In every sense this was a blunder, and a blunder that may be fairly attributed to a general lack of information on the part of the House as to the supreme importance of the mineral industries. However, the Select Standing Committee is better than nothing.

Throughout March, April and May the Committee held four meetings. Delegates from the Canadian Mining Institute gave evidence, chiefly on points connected with the granting of mineral rights. The heads of the two branches of the Department of Mines also were questioned. No other witnesses were called.

The printed account of the proceedings of the Standing Committee impresses the reader in several respects. In the first place it is apparent that the members during the first three sessions were bogged. From the minutes of discussions we gather that no one knew what was to be dealt with.

Receiving the evidence of the witnesses was the only work accomplished. At the fourth meeting, however, the Dominion mining regulations and the mining law affecting the Yukon were taken up section by section. Three important resolutions resulted from this meeting. They were:—

1. That there should be assigned to the Department of Mines the administration of mines, including the issue of title thereto, and of all mining laws.
2. That an Act should be passed consolidating all the laws relating to mines under Federal control.
3. That consideration should be given to a policy that will have for its object the re-acquisition by the Crown of mining rights heretofore granted in patents of land.

Of these resolutions, the first calls for most immediate attention. The present cumbrous system gives

rise to confusion and is an actual deterrent to investors. Moreover, there is ground for the belief that grave abuses exist in mining districts that are under Federal administration. This has been true of the Yukon; it is true, we fear, of Alberta. This resolution is timely.

The second resolution, referring to the consolidation of all Federal mining laws, might well be extended to embrace the laws of each Province. Naturally this is a matter that demands long debate and systematic study of the mining laws of foreign countries. Only thus can pitfalls be avoided. Essentially this is work that can best be done by the continuous efforts of a Royal Commission. It is doubtful if any committee, meeting twice or thrice a month, can cope successfully with a subject so large and so intricate.

The last resolution requires little comment. If our country is to reach its appointed goal, all restrictions and hindrances must be removed from the path of the prospector. To-day, thousands upon thousands of square miles of mineral territory may be regarded as lost to the prospector. This applies with equal force to lands administered by the Provincial Governments.

During the coming winter the Committee will continue its investigations. It has succeeded in starting on the right path. But it will require guidance and direction. Last year's delegation from the Canadian Mining Institute was hastily summoned, was by no means representative, and, individually, the delegates were given insufficient time to prepare themselves. Further, the Committee as a whole lacked knowledge of the mining industry.

The latter condition will remedy itself, and it is the duty of the Canadian Mining Institute to see that future delegates have ample time to prepare their evidence. In fact this is a subject that should engage the attention of the executive of the Institute throughout the winter. A strong committee should be appointed at once. The Institute can do more than any other body to enlighten Ottawa as to the requirements of mining.

Incidentally, we can see little use in having twenty-five members on the Select Standing Committee of the House. Ten carefully chosen members would accomplish more in a given time with less friction and with more effect. The attendance at the four meetings last session never exceeded fourteen, and once dwindled to five. What results can we expect in these circumstances?

A Royal Commission, consisting of five selected and representative men, adequately remunerated for their labours, would have arrived long before this at results that will not for many months be attained by the Committee as at present constituted.

Our hope is that the very meagreness of the reports under discussion will induce the Select Standing Committee itself to recommend a Royal Commission.

### THE MINERS' MINE.

That capital and caste have their uses was demonstrated in a curiously effective manner by the failure of a socialistic venture in France.

It was in the year 1891 that a concession of about 200 acres of coal lands in the Loire coal basin was purchased largely by public subscription, and placed in the hands of an association of workingmen, amongst whom all profits were to be equally divided.

With a tremendous flourish of trumpets the Miners' Mine became an active producer of coal.

Before affairs had got decently in working order trouble arose. Outside miners, not members of the society, were employed by the regular members. The outsiders claimed a share in the profits.

Another source of strife and heart-burnings was the fact that during the times of depression, a general reduction in wages had to be made. Against this the miners kicked violently. The logic of the situation did not appeal to them. The controlling power of capital was absent, and wages fluctuated with every temporary vicissitude.

The impatience of the miners (in this case the shareholders) and the ludicrous impossibility of the whole scheme, became most potent in 1905. In that year no less than five chairmen were successively elected and deposed.

The closing scenes in the history of the Miners' Mine were enacted in the autumn of 1908. An exhausted treasury, urgent creditors, two serious fires and severe trade depression, together with internal dissensions were more than the shaky edifice could stand. The collieries were closed, a receiver was appointed, and the society breathed its last painful corporate breath.

It is not for us to say that all such experiments are foredoomed to failure. But there does appear to be an illustration here of the futility of attempting to apply the fantastic principles of socialism—the socialism that is expounded by labour agitators—to a modern business enterprise. We fear that before a Miners' Mine will have proved a commercial success coal will have been superseded as a source of energy.

---

### INSPECTION OF MINES.

Already in the United States there are indications that mine inspection is to become a conjoint function of the Federal and State authorities. This has been proved the more imperative by last year's shocking coal mine catastrophes. The United States Geological Survey has taken the matter in hand, and has begun an educational campaign.

Doubtless this consummation will not be reached rapidly. Difficulties expected and difficulties as yet unforeseen will crop up. But it must be brought about sooner or later, for only thus can the highest degree of safety be guaranteed to those who labour underground.

What is true of the United States is doubly true of Canada. Uniformity in our mine inspection regulation

is needed. So long as inspection is left entirely to provincial officials it will be neither adequate nor effective. Working hand-in-hand with a well-organized Federal Bureau, the provincial departments would do infinitely better than is at present possible.

The Nanaimo disaster provides material for very serious thought. It is possible, nay, even probable, that proper inspection would have prevented the loss of 32 lives.

The civilized countries of the world not only insist upon the regular inspection of coal mines for the presence of dangerous quantities of gas but they also regulate the use of safety lamps, prohibit certain explosions, investigate the hygienic conditions of collieries, investigate the causes of accidents, and encourage the use of rescue apparatus.

We fear that Canada has not done her duty in these respects. Apparently we are content to wait until the toll of human lives shall have become so inordinately large that indifference will no longer be possible.

#### DORIC RESERVE MINES, LIMITED.

In the Toronto World of October 11th, and in the Montreal Standard of October 16th, appeared advertisements of the Doric Reserve Mines, Limited. The name of Mr. A. A. Hassan, mining engineer, was used in these advertisements. We have been requested by Mr. Hassan to state that he has made no report for the Doric Company and that he could not possibly verify the statements advertised. Mr. Hassan is taking steps to force the offenders publicly to retract their misstatements.

Prompt action of this kind is to be commended. Liberties taken with the good name of mining engineers deserve severe punishment.

#### EDITORIAL NOTES.

We are informed, on excellent authority, that, in addition to the iron and steel works projected for Vancouver Island by the Irondale Syndicate, another large steel concern contemplates the erection of a plant. This will give Vancouver a solid industrial backbone.

An editorial in the November number of The Mining Magazine concludes thus: "Vendors and promoters should not report on mines; it is as honourable to be a promoter as to be an engineer, but the combination is prejudicial to sound business." This truth cannot be repeated too frequently. At the present stage of development it applies with especial force to Canadian mining engineers.

Estimates secured by the Royal Commission on Mines give the cost of watering the workings of large collieries by the "man and hose" system. In one Ger-

man mine the cost, over a period of 14 years, averaged 1 1-2d. per ton. At another German colliery the cost in material and wages was slightly over 1d. per ton. Costs in South Wales range all the way from 1.72d up to 5d per ton. The last figure includes repairs to roadways rendered necessary by the watering.

#### CORNISH TUNGSTEN ORE.

At the semi-annual meeting of South Crofty, Limited, a mining company operating at Carn Brea, Cornwall, some instructive figures were adduced bearing upon prices current for tungsten ores.

The ore-treatment is complex. Tin, tungsten, and arsenic are recovered. During the six months ending June 30th, 335 tons of tin, 72 tons of tungsten concentrate, and 304 tons of arsenic (200 tons of the arsenic being white refined) were recovered from 29,154 tons of ore; 31.8 pounds of tin and tungsten were recovered per ton of ore crushed. The total value of the three commodities was £34,056 19s 14d.

During the six months an arsenic refinery and twenty stamps were added to the surface plant. Including development and additions, the average working costs were 19s 3d per ton. Total profits amounted to £6,187 14s 1d; net profits, £5,187 14s 1d.

The average price for tin was £76 3s 2d; for tungsten, £78 9d. Tungsten showed a falling off of £10 per ton as compared with the previous six months. But latterly the price has improved substantially. The tungsten concentrate was kept constantly up to 64 per cent.

#### PLATE HOUSES.

The use of heavy stamps on the Rand has brought about one radical modification in mill design. The latest mills are constructed with separate houses for the amalgamation plates, as it has been found advantageous to remove entirely the plates from the crushing section of the mill.

This innovation permits of any desired arrangement of the plates. Inasmuch as the product of any one battery may be diverted to each of several plates, the necessity of hanging up a battery before cleaning the plates is obviated. The time saved by this is supposed to add at least 10 per cent. to the efficiency of the plant.

Another hardly less important result is the facility with which samples of the crushed ore may be taken by placing automatic samplers in the launder that conveys the pulp from the stamps to the plate-house.

Incidentally it is possible to watch the tables much more closely. In large plants this makes for better practice, and has the advantage of minimizing amalgam-stealing.

Detached plate-houses have much to recommend them even for small plants.

Gelignite is the most largely used explosive in the mines of Western Australia. Last year 3,251,928 lb. of gelignite were used, as compared with 438,500 lb. of blasting gelatine and 339,852 lb. of gelatine dynamite. For the storage of explosives there are 74 magazines in the state, having a total capacity of 11,190 tons. These are placed on reserved land, and are fitted with specially devised lightning conductors.

# THE WINNIPEG MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

(Written for the Canadian Mining Journal by Cyril W. Knight.)

The seventy-ninth annual meeting of the British Association for the Advancement of Science opened in Winnipeg on the twenty-fifth of August. The society has during the last quarter of a century, held three meetings in Canada. In 1884 Montreal was the centre, while in 1897 Toronto was its headquarters. At the Montreal meeting the people of Winnipeg took the opportunity to invite the members to visit Manitoba. Those who did this, and who also this year attended the Winnipeg meeting, have been profoundly impressed with the strides the West has made. As a matter of fact this was one object of the meeting being held in Winnipeg this summer; and the splendidly arranged excursions across the golden prairies of our North-West to the mountains of British Columbia and the Pacific Coast must surely have aided to dispel the false impression given to the British people in Kipling's "Our Lady of the Snows."

It was natural, perhaps, that physics should dominate the meeting in view of the fact that Sir Joseph Thomson was president. He gave his memorable presidential address in the Walker Theatre on the evening of the twenty-fifth, and those who heard it are not apt to forget the occasion for many years. Sir Joseph Thomson has a startlingly clear and deep voice for a man of his stature, and this, combined with a perfect enunciation, made all of the address a delight, even to the layman. The address was of necessity largely technical, but the personality of the man always seemed to hold attention even when the listener could not follow, and the simplicity of his literary style was another added charm. The previous presidents at the meeting of the British Association in Canada were Lord Rayleigh and Sir John Evans. Without attempting to give any complete resume for the Canadian Mining Journal of an address on physics the parts bearing only on geological matters are here stated. But, in passing, it is interesting to note his urging of the deeper study of mathematics on all physicists, and the plea that mathematicians study physics. The billiard player need no longer regard his expertness as the sign of a wasted life. One of Sir Joseph's first pupils was in the beginning utterly indifferent to mathematics, but was an expert billiard player. Sir Joseph showed his pupil that the collision of elastic billiard balls illustrated profound mathematical laws. "From that time he was a changed man. He never before regarded mathematics as anything but a means of annoying innocent graduates. Now, when he saw what important results it could obtain he became enthusiastic about it, developed very considerable mathematical ability, and, though he had already wasted two out of three years at college took a good place in the mathematical Tripos."

The recent advances made in the study of radio-activity, and their bearing on geological problems were particularly interesting, and the following paragraphs are given in full.

"The properties of radium have consequences of enormous importance to the geologist as well as the physicist or chemist. In fact, the discovery of these proper-

ties has entirely altered the aspect of one of the most interesting geological problems, that of the age of the earth. Before the discovery of radium it was supposed that the supplies of heat furnished by chemical changes going on in the earth were quite insignificant, and that there was nothing to replace the heat which flows from the hot interior of the earth to the colder crust. Now, when the earth first solidified it only possessed a certain amount of capital in the form of heat, and if it is continually spending this capital and not gaining any fresh heat it is evident that the process could not have been going on for more than a certain number of years, otherwise the earth would have been colder than it is. Lord Kelvin in this way estimated the age of the earth to be less than 100 million years. Now, though the quan-

Sir J. J. Thomson, and wife President of the British Association for the Advancement of Science.

tity of radium in the earth is an exceedingly small fraction of the mass of the earth, the average amount of radium in the material of which the earth's crust is composed, according to the valuable determinations of Professors Strutt and Jolly, only amounts to about five grammes in a cube of the material whose side is 100 miles, yet the amount of heat given out by this small quantity of radium is so great that it is more than enough to replace the heat which flows from the inside to the outside of the earth.

"This, as Rutherford has pointed out, entirely vitiates the previous method of determining the age of the earth. The fact is that the radium gives so much heat that we do not quite know what to do with it, for if there was as much radium throughout the mass as there is in the earth's crust, the temperature of the earth

would increase much more rapidly than it does as we descend below the earth's surface. This, as Professor Strutt has shown, proves that if radium behaves in the interior of the earth as it does at the surface, then rocks similar to those in the earth's crust cannot extend to a depth of more than forty-five miles below the surface.

"It is remarkable that Prof. Milne from the study of earthquake phenomena had previously come to the conclusion that rocks similar to those at the earth's surface only descended a short distance below the surface; he estimates this distance at about thirty miles, and concludes that at a depth greater than this the earth is fairly homogeneous."

His concluding remarks were:

"The new discoveries made in physics in the last few years, and the ideas and potentialities suggested by them, have had an effect upon the workers in that subject akin to that produced in literature by the Renaissance. Enthusiasm has been quickened, and there is a hopeful, youthful, perhaps exuberant, spirit abroad which leads men to make with confidence experiments which would have been thought fantastic twenty years ago. It has quite dispelled the pessimistic feeling, not uncommon at that time, that all the interesting things had been discovered, and all that was left was to alter a decimal or two in some physical constant. There never was any justification for this feeling, there never were any signs of an approach to finality in science. The sum of knowledge is at present, at any rate, a diverging not a converging series. As we conquer peak after peak we see in front of us regions full of interest and beauty but we do not see our goal, we do not see the horizon. In the distance tower still higher peaks, which will yield to those who ascend them still wider prospects, and deepen the feeling, whose truth is emphasized by every advance in science, that "Great Are the Works of the Lord."

The meetings of the different sections of the society were begun on the twenty-sixth and continued until the last day of August. It was necessary to distribute the sections among the various public buildings of Winnipeg. In spite of the almost appalling number and variety of subjects taken up, only morning sessions were for the most part held. It would seem that the Canadian Mining Institute, which holds at times three sessions a day until one is dizzy with new ideas—and smoke—might well consider this arrangement. The scientific work of the Association is transacted under the following departments of knowledge:

- Section A—Mathematical and Physical Science.
- Section B—Chemistry.
- Section C—Geology.
- Section D—Zoology.
- Section E—Geography.
- Section F—Economic Science and Statistics.
- Section G—Engineering.
- Section H—Anthropology.
- Section I—Physiology.
- Section K—Botany.
- Section L—Educational Science.

The papers of Section C, Geology, only are here given:

President's Address—The Evolution of Vertebrate Animals as Shown by Fossils.

J. B. Tyrrell—The Geology of Western Canada.

A. P. Coleman—The Extent of the Ice Sheets in the Great Plains.

Warren Upham—The Glacial Lake Agassiz.

E. F. Chandler—The Rainfall Run-off Ratio in the Prairies of Central North America.

A. P. Coleman—The Bearing of Pre-Cambrian Geology on Uniformitarianism.

W. G. Miller—The Pre-Cambrian Rocks of Canada.

A. R. Dwyerhouse—An Outline of the Glacial Geology of Britain, illustrative of the work of the Committee on Erratic Blocks.

Aubrey Strahan—The Glacial Geology of South Wales.

David Woolacott—On the Classification of the Permian of the North of England.

Herbert Bolton—New Faunal Horizons in the Bristol Coalfields.

S. H. Reynolds—Description of the Avon Section, Bristol, in illustration of Dr. A. Vaughan's work on the English Carboniferous Limestone.

S. H. Reynolds—Lithology of the Carboniferous Limestone of Burrington Combe, Somerset.

Ernest Discon—On Some Structures in Limestone Formations.

#### PAPERS ON THE ORE DEPOSITS OF CANADA.

Prof. S. H. Reynolds, M.A.—Certain Aspects of British Scenery as illustrating the work of the Geological Photographs Committee (Lantern).

E. S. Cobbold—On Some Further Excavations Among the Cambrian Rocks of Comley, Shropshire, 1908.

Prof. S. H. Reynolds, M.A.—Report of the Committee on the Geology of Glensaul, Co. Galway (Lantern).

Report of the Committee on the Drift Deposits of Kirmington, etc.

Report on the Crystalline Rocks of Anglesey.

Report on the Chemical Composition of Charnwood Rocks.

Report on the Salt Lakes of Biskra, Algeria.

In his presidential address to the geological section, A. S. Woodward said there had been an unfortunate tendency during recent years for the majority of geologists to relinquish the study of fossils in absolute despair. More ample material for examination and more exact methods of research have altered many erroneous names that were originally used; while the admission to scientific publications of too many literary exercises on the so-called "law of priority" has made it necessary to learn not one, but several names for some

of the genera and species which are commonly met with. He finds that it is necessary to combat the mistaken popular belief that the main object of studying fossils is to discover "missing links" in the chain of life. The geologist, on the other hand, knowing well that he must remain satisfied with a knowledge of a few scattered episodes in the history of life which are always revealed by the merest accident, marvels that the discovery of "missing links" is so constant a feature of his work; and he is convinced that, if circumstances were more favourable, he would be able to satisfy the demand of the most exacting critic. He has found enough continuous series among the mollusca, for example, and so many suggestions of equally gradual series among the higher animals, that he does not hesitate to believe without further evidence in the process of descent with modification. The mere reader of books is often misled by the vagaries of nomenclature to suppose that the intervals between the links are greater than in reality; but for the actual student it is an everyday experience to find that fossils of slightly different ages which he

than chance-variation or response to environment however much these phenomena may have contributed to certain minor adaptations.

The paper by Warren Upham on the glacial Lake Agassiz was interesting because the city of Winnipeg is built on the bottom of this lake; and for many miles the country is to the eye perfectly flat. It attained an area of about 110,000 square miles, exceeding the combined areas of the five great lakes tributary to the St. Lawrence River, and at the present day it is represented by Lake Winnipeg. In its earliest and highest stage Lake Agassiz was more than five hundred feet deep above the site of the city of Winnipeg.

A. P. Coleman, in his paper on "The Bearing of Pre-Cambrian Geology on Uniformitarianism" would have us believe that a glacial period existed during the time in which the Homer Huronian conglomerates were laid down. On the Trethewey property at Cobalt he has found pebbles in the conglomerate which have scratches on them that are exactly similar to those scratches and markings found on pebbles and boulders

SILVER ISLET, LAKE SUPERIOR.

once thought distinct are linked together by a series of forms in which it is difficult to discover the feeblest lines of demarcation. He is therefore justified in proceeding on the assumption that in all cases the life of our geological period has passed by a natural process of descent into that of the next succeeding period; and, avoiding genealogical guesswork which proves to be more and more futile, he strives to obtain a broad view of the series of changes which have occurred, to distinguish between those which denote progress and those which lead to stagnation or extinction. When the general features of organic evolution are determined in this manner, it will be much easier than it is at present to decide where missing links in any particular case are most likely to be found.

Mr. Woodward desired especially to emphasize the interest and significance of the persistent progress of life to a higher plane, which we observe during the successive geological periods. For, he said, palaeontologists are now generally agreed that there is some principle underlying this progress much more fundamental

in glacial till or boulder clay. In the fine-grained greywacke large granite boulders occur, which apparently have been transported some miles from their source. A glacial origin, he thinks, can only explain their presence, and the widespread occurrence of the conglomerate is another point emphasized. Dr. Coleman read a similar paper a year ago last January before the Geological Society of America at Albuquerque. It was pointed out then by Van Hise and others that if these conglomerates are glacial in origin we ought somewhere to find the glaciated basement on which they rest. This has never been found. On the contrary, wherever the contact of the conglomerate with the underlying Laurentian granite and Keewatin greenstones has been studied the basement is breaking down in situ. Therefore it is certain that some of the Lower Huronian has been found in place and not transported by ice. To this it is replied by Dr. Coleman that the double-clay of to-day in many places rests on a surface which shows no glacial scratches and that further, the Dwyka, in South Africa, does not always have a glaciated

basement. Regarding the presence of the large granite boulders in the conglomerate, it was pointed out by Dr. Miller in his Cobalt report some years ago, that their presence could not be taken as proof of a glacial origin, because they might be transported by severe floods or freshets. Prof. Hobson, of Manchester, England, in summing up the case, remarked that the

Fine example of Spheroidal Weathering of Trap, Sudbury, Ont.

finding of scratched pebbles in one place only was hardly sufficient evidence of the glacial origin of the Lower Huronian conglomerate, because it was reasonable to suppose these scratches might be produced by other agencies. But that if in several widely separated areas scratched boulders and pebbles were discovered the case would have a different aspect. All geologists are quite willing to admit the probability of a glacial period in Pre-Cambrian times, and while several points have now been brought forward which support the theory, it has not as yet been accepted by all. Until a true glacial basement has been found the subject will remain an open question. Prof. Fairchild, on the other hand, considers that it is not surprising that the glaciated floor has been destroyed. Meanwhile the controversy has led to many interesting discussions.

W. G. Miller briefly reviewed the pre-Cambrian rocks in Canada. He pointed out that these occupied the largest area in America. In them occur the enormous iron and copper deposits of the Lake Superior region, the nickel, copper and silver deposits of Sudbury and Cobalt, and so on. An exceedingly small fraction of these pre-Cambrian rocks only has been prospected, so that an optimistic outlook of the future mining industry in these unexplored regions would seem justified.

On reading his paper on the glacial geology of Britain, A. R. Derryhouse remarked that it might seem

rather absurd to us in Canada that a committee should be organized to preserve the erratic blocks found in Britain. This was necessary, however, because they were being slowly destroyed in some parts. His paper showed the very complex nature of the glaciation in Britain.

Gold, silver, copper, nickel, iron, placer mining, and the rare metals in Canada were briefly reviewed by A. P. Coleman, W. A. Miller, J. B. Tyrrell, and T. L. Walker. In the discussion which followed on the origin of the Sudbury nickel deposits it was pointed out by Prof. Gregory that the work of Dickson, Campbell and others, who regard the economic bodies of ore to be largely of secondary, rather than igneous, origin, should not be ignored.

A paper which was most interesting to students of Keewatin lavas in America was read by Tempest Anderson, on the "Volcano of Metavanu." He discussed the actual forming of pillow or ellipsoidal lavas in water. As is well known our Keewatin series in the United States and Canada is regarded as being made up of submarine basic lava flows, one of whose characteristics is this pillow or ellipsoidal texture. So that the story of these structures in the making by a keen observer who had just returned from actually seeing was of great interest.

From Sudbury the party went to Fort William and there chartered a steam launch in order to spend a day

The old miners' cottages at Silver Islet have now been turned into haunts for the summer girl.

at Silver Islet. Here we found the piers and buildings fast falling to pieces and moss everywhere on them. The structure in which the Frue Vanner had its birth is still there, but of the original machines nothing remains. A new era has come. Along the mainland opposite the island a long row of miner's cottages have now been

turned into haunts for the summer girl, and excursion boats convey picnic parties to the celebrated spot where in former years old time miners and car-loads of machinery were launched. Even the rocks have changed. The dump from the underground working was thrown into the lake and the blocks and fragments of calcite and harder trap have now become rounded like the ordinary pebbles found on the sea shore. This was most interesting and instructive to the geologists, showing as it did the comparatively short time in which wave action destroys rock fragments.

After the meeting in Winnipeg about two hundred officers and guests of the Association left for the West in what was popularly spoken of as the science special train. The arrangements made by the Canadian Pacific and Canadian Northern were most satisfactory. The prairie country, that strange region of wonder and monotony, received its due share of attention, and short stops were made at Regina, Moose Jaw, Calgary and Edmonton. There must indeed be some strange fascination which holds men and women on these treeless, rolling plains, where houses are far apart and where the beauty of the East is not.

From the prairies the special was slowly pulled up into the snow-capped Rockies, from whose breasts at Banff flowed the hot sulphur springs, and the ice cold stream from the glaciers. They saw, nestling near the foot of a ridge, within sight of the hotel, the Alpine Club, that home of enthusiasts who climb to the dizzy heights of the rarer atmosphere for reasons other than the glory of God. While below, in the valley of the Bow River, a herd of buffalo preserved by the Dominion Government, looked up in quiet wonder at it all! At Laggan the point of interest was Lake Louise, some six thousand feet above sea level, and surrounded on three sides by abrupt mountains as high again. Further west still, in the heart of the Selkirks, the party stopped at Glacier, where within half an hour of the railway station and hotel the foot of a great glacier was examined.

From here to the Pacific Coast is a journey of about three-quarters of a day. A short time was spent at Vancouver, where Stanley Park, whose flora is almost tropical, was seen by some of the party. Then the fastest boats on the Pacific Coast, owned by the Canadian Pacific Railway, were taken to Victoria. Some of the members ran south to Seattle, in which city the Alaska-Yukon-Pacific Exposition is being held. Among the great number of buildings the forestry structure was, perhaps, the one most admired. It is built of enormous fir trees, all said to have been obtained within a radius of fifty miles of Seattle. The front part of the building, a photograph of which is here shown, is supported by fir trees several feet in diameter. The bark was allowed to remain on this timber, and the building will be preserved for the University of Washington.

In the Canadian building there were many things to make the British subjects of Canada very much at home. Especially did this apply to the miner and geologist, for the familiar look of the silver ore from Cobalt, the nickel sulphides of Sudbury, the feldspar of Frontenac County, the coals of the Maritime Provinces and the gold and copper ores of British Columbia made one feel quite sure that he was in his native land.

The return journey over the prairies was made on the Canadian Northern Railway, and the main party reached Winnipeg on September the thirteenth. Several, however, went from Victoria to the gold fields of the

Yukon, others to California, and thence to New York via the Grand Canyon of Arizona.

A breezy writer in the Winnipeg Free Press Bulletin sums up the excursion in this manner:

"Assuredly no such train as the science special has ever before traversed the 1,500 miles between Winnipeg and Vancouver. From the historic universities of the United Kingdom, from the newer seats of learning of the great industrial centres, from institutions of renown like the British Museum, from the Canadian and the American universities have come these men of science. Among them have been the heads of great laboratories of research, designers of battleships, heads of geographical and geological surveys, great chemists, great physicists, great anthropologists, great mathematicians and great astronomers. These are the men who have been revising, and in many cases radically revising, their estimate of western Canada. In the old land amid much wealth and much sordidness, in the throng of the many who have failed and of a few who have

Canadian Pacific Railway Cut, Sudbury District, in which the nickel deposits were first discovered.

succeeded brilliantly, these men of science have lived and moved and had their being. There they pass to and fro within narrow limits. They are not seen or heard except by a sprinkling of their fellows. They pass down the streets of the great city unknown and unnoticed. They smile not upon the multitude. They conceal their look from the crowd.

"In Western Canada these self-same men have broadened, have expanded, have opened and unbent. They have gone through the train and strolled along the platform with smiling countenances. They have shaken hands and conversed with westerners whom they did not know and whom probably they will never see again and they did it without being introduced.

"They have eaten onion salad and angel cake in a Methodist church in Calgary. They have waited their turn for washing and shaving, and have joked while they waited. They were approachable everywhere, and at all times. Indeed, they approached others. In brief they were sociable, genial and jocular. They told every one they were enjoying themselves and they were."

# ELECTROCHEMICAL PLATE AMALGAMATION.

(By Elmer Ellsworth Carey.)

[Note.—The original draft of the following article first appeared in the May, 1909, issue of the *Electrochemical and Metallurgical Industry*, of New York. For the purpose of explanation and to emphasize certain points, the author has added a few paragraphs, and made some changes in the text. The amended article appears below.—Editor.]

Within the last decade the problem of using electricity in a practical and efficient manner in the extraction of values in metallurgical processes has received the earnest attention of many investigators. It has long been known theoretically that the action of mercury and cyanide may be greatly intensified by the introduction of electrochemical conditions, and inventors have been at work on the problem of constructing suitable apparatus to make practical use of the powerful aid of the electric current.

One of the first applications of electrochemics to modern metallurgical methods consisted in suspending a plate (cathode) in a cyanide tank and recovering the values thereon directly by electro deposition. This slight improvement was found to give an improved extraction, and it is strange that the matter did not receive more attention, as this advance, slight as it was, pointed the way to still greater improvements, and was a hint that should not have been overlooked.

The next step was to electrify the entire contents of the tank, thus reinforcing the cyanide with the powerful cleansing and reducing action of electrochemical forces; with proper electrolytic conditions it was found that the percentage of extraction is much higher and the time of treatment much shorter; and at the same time, as the values pass into the solution, they are simultaneously deposited on the amalgam plate by the electro-plating action of the current, and the cyanide released for another cycle. The great efficiency of this system over the usual cyanide methods has been fully demonstrated; it is quicker, more positive, extracts a higher percentage of values, costs less to install and to operate, and in addition will extract values from pulp which is not susceptible to the action of ordinary cyanide solutions.

Turning to the amalgamating practice, it may be said that electrochemical methods may now be successfully used in connection with the usual battery plate. After a long series of experiments, extending over a score of years, a very simple method of converting the standard plate into an electrochemical amalgamating device of remarkable efficiency has been devised. The electrochemical system of amalgamation is designed to extract from the sands or pulp all gold values not encased; it is entirely a new system of amalgamation, designed to do the work of the ordinary mill plate, including the treatment of slimes, and at the same time to extract values which cannot be saved by the usual mill practice and which otherwise would require cyanide treatment; to do all this in one single inexpensive and continuous operation, requiring practically no more outlay for installation and maintenance than the usual mill plate. The system also furnishes a method by which the Alaska beach deposits, black sands, hydraulic, placer and dredge tailings, mill tailings, desert deposits and many low grade propositions can all be profitably

worked. The broad claim made for the electrolytic system is that it will save all values not encased.

**Preliminary Treatment.**—It may be sometimes necessary to grind ore or sands to 100, 150 or even 200 mesh, before the values are released, but after this has been done, the pulp is simply passed over the amalgamating device, and the electrochemical forces automatically extract the values to such an extent that usually no further treatment is profitable. In ordinary cases, values are recovered at 80 mesh. In certain cases where the ore is unusually refractory, base or rebellious, it may be necessary to treat the tailings for an hour or two by the continuous electro-cyanide process, which is an exceedingly simple and inexpensive operation, but withal very efficient.

**Mode of Construction.**—The electrolytic method of amalgamating calls for a sluice box of suitable width, the length being 40 or 50 feet, or even longer, according to conditions. In the bottom of the box is an ordinary copper plate acting as a cathode. Graphite anodes of suitable construction are arranged to conduct the low voltage current into the water (electrolyte) passing over the device. Pulp of proper fineness, screened gravel or sand is passed into the apparatus by suitable means. Certain solutions are also added to the water. A critical low voltage current of proper amperage is passed into the anodes; the water, carrying pulp, etc., acts as an electrolyte, and makes the electric connection with the copper plate (cathode). In operation the water is at all times electrified and the copper plate is also constantly under electrical action. The device can be made of any desired capacity.

**Essential Elements of the System.**—So far as the electrochemical actions and processes are concerned, there are five cardinal conditions or points to consider:

- (a) The anodes.
- (b) The flowing body of water, pulp, slimes, etc. (electrolyte.)
- (c) The copper plate (cathode.)
- (d) Certain solutions added to the water: 1. Mercurial solution; 2. Sodium solution; 3. Hydrogen solution.
- (e) Low voltage current.

The anodes and cathodes are connected with a 5-10 volt generator in the usual manner; the usual volt meter rheostat and ammeter being in place. The current used has approximately the density of about five-tenths of an ampere per square foot of cathode surface.

In operating, the mercury solution is mixed with the water passing into the device. The amount of the solution, which is standardized, depending upon the values in the pulp. About the same amount of mercury is needed as in the ordinary practice. Practically all the mercury is recovered in the amalgam. Several chemical, electrical and electrochemical processes are constantly and simultaneously in operation. When the machine is once adjusted for given conditions, these processes and reactions are synchronous, automatic and mutually balanced, all of them combining perfectly to assist in the recovery of values. In this system, the various powers, affinities and laws of electro-chemics have been perfectly balanced and harmonized to produce certain desired results, and the system beautifully illustrates how nat-

ural laws may be used to serve mankind when intelligently adjusted and applied. A few more important reactions will now be mentioned.

**Intensified Chemical Action.**—All chemical action is greatly intensified under critical electrical conditions. Amalgamation is a chemical action, and the affinity of mercury for the metals is greatly quickened by the electrical current. The chemical processes described below are much more rapid and effective under the electrolytic conditions than they usually are. In a similar manner the action of a cyanide solution can be greatly augmented and intensified; in electro-cyanidation values are recovered which are refractory in the usual solutions; and the time of treatment is reduced to one or two hours, while the gold is recovered by electro-deposition in the form of amalgam.

**Deposition of Mercury.**—The even, constant and uniform deposition of virgin (nascent) mercury on the cathode plate is the crucial operation of the system. The mercury is deposited from the mercuric solution mentioned above by ordinary electrolytic action; an electroplating process is in operation, and we have the cathode plate covered with a bright, uniform and chemically pure coating of nascent mercury, which remains in a perfectly "healthy" state as long as working conditions continue. The deposition of mercury and the character of the amalgam are at all times under absolute control of the operator. The mercury coating or plating adheres tenaciously to the copper plate, and the passing volumes of water, sand, pulp, etc., have no effect upon it. With proper adjustment, no excess of mercury is possible, and no "floured" mercury is discernible in panning the tails. This coating or plating of mercury above mentioned will stand the action of a heavy volume of running water containing a full load of pulp; even water carrying a full load of magnetic iron has no injurious effect upon it.

The mercury deposited by electrolytic action is nascent or virgin mercury; its affinity for metals and gases is far greater than usual; its amalgam-forming powers are intensified to such a degree that rusty, greasy or pyritic gold is instantly amalgamated; platinum is absorbed as quickly as gold when sodium is present in the amalgam (see Sodium Amalgam). Grease, talc, silicious coatings or sulphurous conditions in connection with gold particles have no effect in preventing amalgamation, and "fouling" or "sickening" of the plate is impossible. The use of electrolytic amalgamation insures at all times a constantly bright, healthful and powerfully active mercurial surface, impossible under the usual practice. The behaviour of the mercury under electrolytic conditions is entirely different from its action in ordinary amalgamating practice; and conclusions based on the usual mill practice will not apply in the new method.

**Nascent Hydrogen.**—Hydrogen at the moment of its liberation from a compound is known as "nascent" hydrogen; the gas in this condition has much more powerful affinities than ordinary hydrogen; nascent hydrogen has increased powers as a reducing agent; it destroys instantly organic, greasy and foul conditions; it unites instantly with the oxygen of iron rust at ordinary temperatures, thus cleaning "rusty" gold; all impurities in the water are counteracted, and the action of nascent hydrogen on the mercury is such that fouling of the plates cannot occur. One authority states that in the presence of nascent hydrogen, mercury cannot "sicken" or oxidize or become sulphated.

The action of nascent hydrogen as a cleanser and reducing agent is used to advantage in the electrochemi-

cal amalgamator, and if the gold particles are unusually coated or rusty, additional volumes of hydrogen can be obtained through electrolysis by adding some inexpensive solution of potassium or sodium. Under the action of electrolysis, the mercury as fast as deposited, absorbs free hydrogen, which is occluded throughout the whole mass of mercury; large volumes of hydrogen are thus absorbed, and the gas is all the time exercising a powerful cleansing and reducing effect, and preparing the way for amalgamation. Mercury, which has absorbed hydrogen under these conditions, is in the best possible condition to form amalgams.

**Formation of Sodium Amalgam.**—When sea water is used in the electrolytic system of amalgamation, or when a solution of common salt, or some solution containing a sodium salt is mixed with the water entering the device, we have the deposition of nascent metallic sodium by electrolysis; nascent sodium is brought into contact with nascent mercury, and a sodium amalgam is formed, which is absolutely pure chemically; we may say sodium amalgam in its "nascent" state is formed, in which state it must always remain healthy; it also in this state, has a much stronger affinity for the metals than the usual sodium amalgam of the arts. Sodium amalgam will hold free gold in any condition; also platinum; at least hydrogen-sodium amalgam will amalgamate all metals not encased, which are in a comminuted state and sodium amalgam by electrolysis cannot be made without the presence of hydrogen. Free sodium also destroys organic substances, and acts as a general cleanser in the chain of operations.

**Hydrogen-Sodium-Amalgam.**—In Volume 1, Proceedings of the London Inst., Min. and Met., page 205, will be found an article by P. G. Warnford Lock, E.M., in which he describes the formation of hydrogen-sodium amalgam and mentions the powerful affinity between this amalgam and gold. In electrolytic amalgamation the hydrogen is formed in several ways:

- (a) By the electrolysis of  $H_2O$ .
- (b) By the electrolysis  $HgCl_2$ .
- (c) By the electrolysis of various salts, which may be used for the formation of hydrogen.

Part of the hydrogen liberated is occluded by the mercury forming hydrogen-sodium amalgam, and part is used in reducing oxides which form rusty coverings on gold particles; parts also act as a general cleanser and purifier as it escapes through the water. In leaving this paragraph, I would remark that in an amalgam of hydrogen, sodium and mercury formed under nascent conditions, we have a trinity of the most powerful amalgamating agents at present known, and amalgamation will take place even in the presence of silicious coatings, rusty, sulphurous, greasy, arsenical, pyritic conditions, or other adverse conditions which usually prevent amalgamation.

**Formation of Gold Amalgam.**—We have seen above how the presence of hydrogen and sodium prepares the way for amalgamation. So well has the work been done that amalgamation takes place as soon as a particle of gold touches the quickened mercurial surface. And it might be noted in passing that amalgam formed under the conditions which we have described (electrolytic amalgamation) is a different compound from the usual amalgam formed on mill plates. The amalgam as described holds to the plate very tenaciously as it is placed there by electrolytic action, and it is not easily dislodged. It is homogeneous, tenacious and free from foreign materials. Particles of amalgam under this system are not broken off by the passing volumes of

water. The larger particles of gold will come in contact with the mercury before passing many feet; microscopic values or float gold, or values in slimes will require a longer length of cathode surface; at times possibly 40, 50 or even 60 feet will be required, but any microscopic particles, or any of the values in slimes will be instantly arrested at the first contact with the mercurial surface. Microscopic values and fine particles of gold in suspension are coated with mercury the moment they enter the zone of electrical action, and the cataphoretic action of the electrical current assists in forcing them into contact with the mercurial surfaces. Experiment has demonstrated that electrolytic amalgamation will recover from 95 to 99 per cent. of all gold not encased, and in many cases the extraction reaches 100 per cent. Usually when the pulp of refractory ores is ground to 100-200 mesh, the tailings after passing the electric amalgamator, do not contain enough values to make any form of supplementary gold saving devices necessary.

**Electrolytic Amalgam.**—Amalgam found under the above described conditions is electrolytic amalgam or "nascent amalgam"; it is formed by particles of gold which have been cleaned and coated with an electroplating of mercury, coming into contact with nascent mercury. The resulting amalgam has entirely different qualities from the usual mill plate amalgam. Electrolytic amalgam is soft, smooth, homogeneous, elastic, tenacious yet plastic; it cannot be eroded by passing volumes of water and pulp; it does not crumble; it is never sulphated; it contains no foul conditions; it forms an ideal surface for the absorption of any passing particle of gold or amalgam; it is "alive," has the greatest possible affinity for gold, and no mill man ever saw a more beautiful and perfectly "healthy" amalgamating surface, for the electrolytic amalgamating surface is, metallurgically considered, the acme of perfection.

**Chlorine Gas.**—Nascent chlorine is liberated when common salt or bi-chloride of mercury are electrolyzed in solution; chloride water is formed; chloride under such conditions cleans and brightens gold by reducing the oxides; chlorine and hydrogen also unite to form hydrochloric acid which attacks all kinds of impurities attached to the gold particles. Chlorine gas is the most powerful bleaching agent known. It is possible that microscopic particles of gold in slimes may unite with chlorine or hydrochloric acid and form compounds, from which gold is liberated, and deposited on the cathode plate by electrolysis.

**Electrolysis of  $H_2O$ .**—The decomposition of water has been mentioned and the action of free hydrogen described. Nascent oxygen is liberated which also assists in preparing values for amalgamation. Oxygen in this state is a powerful enemy of organic substances, and foul, greasy or dirty conditions are quickly eradicated by its action.

**Mechanical Action of Gases.**—At all times there are liberated from every portion of the surface of the cathode free gases which arise upward through the water. These constantly escaping gases have a tendency to act as a cushion over the newly formed amalgam, which cushion prevents in a measure any scouring effect on the part of both sand or gravel, thus rendering the system equally applicable to stamp mills, placer mines, gold dredges and beach mining. Gravel and black sand can be passed over the device, and freed from all values, no matter how small, which may be present.

**Dynamic Electrical Action.**—The claim is made that a critical electrical current when properly adjusted tends to force all gold particles to the cathode plate, and that such current actually does carry microscopic particles into contact with mercury; and that the efficiency of this force depends upon density, voltage and proper adjustment of the device. There is considerable evidence to support this contention that there is a dynamic action in the electrical current which carries gold particles to the cathode. As a rule, all values are deposited in the mercury in the first ten or twelve feet of plates; and it is hardly reasonable to suppose that gravity alone would be sufficient to force every particle of gold into an amalgamating contact in such a volume of water as is used. If the necessary contact for amalgamation was the result of chance and gravity, it would be reasonable to look for an occasional colour in the tailings; but not only is it impossible to find a colour there by the most careful pannings, but it is impossible to find any value of importance by the most careful assay. In view of this fact, and other facts which have been noted, it is reasonable to suppose that there is a dynamic quality in the electric flow which acts directly upon metallic particles of gold; and as Madam Curie and other scientists have pronounced electricity to consist of material ions, this view is not entirely without foundation.

In the system of gold extraction above outlined amalgamation proceeds under the most favourable conditions that can be provided. Every obstacle is removed, and every force that tends to assist is intensified and reinforced. Not in a laboratory could a more positive action be obtained. Instead of leaving the amalgamating process to chance and the uncertainties of the usual practice with all attendant difficulties, we have in the process in question, the formation of amalgam carried on under ideal conditions, where the highest possible efficiency is attained; and it should be remembered that the processes are constantly striving to hold the amalgam in place, and to resist any erosive tendencies of the water and pulp. The amalgam coating is the result of the electroplating action of the device and the amalgam is forced into a perfect contact with the copper plate. In view of these facts it is not unreasonable to believe, that in the near future, electrolytic amalgamation will supersede the older methods, and at the same time vast fields will be open for the miner that are now beyond his means.

There are vast ledges and mountains of low grade and refractory ore, which, with the improved grinding machinery, in connection with electrolytic amalgamation may develop into immense mining fields. For locked up in the immense ledges and deposits of low grade ore, found in all gold-bearing countries, we have a treasure house containing values easily accessible, a thousand times greater than the combined wealth of the nations. When the limited supply of gold from the few high-grade veins is exhausted it is to these vast deposits that the world must turn for its supply of metals for monetary purposes.

The only special machinery required for the electrolytic system of amalgamation is a low voltage generator requiring from  $2\frac{1}{2}$  to 5 horse-power for operation. A 5-horse power generator will furnish sufficient current for the treatment of 500 tons daily.

Whenever the values are microscopic as in the case of slimes, or when the gold is extremely fine and flakey, it will be found that electrolytic mercury raffles or wells

will give excellent results. Electrochemical action can be easily obtained in connection with the standard Hungarian or Australian mercury wells; when such mercury riffles are electrically excited, there is no flouring

or fouling of the quicksilver, and no coating of sulphurets appears. Such riffles are also admirably adapted for recovering values in "black sand" and the fine values in placer and dredge tailings which are universally lost.

## AMERICAN INSTITUTE OF MINING ENGINEERS.

Written for the Canadian Mining Journal by E. Jacobs.

The 97th meeting of the American Institute of Mining Engineers was held at Spokane, Washington, on September 28-29.

The special train conveying the excursion party, which numbered about 60, left Chicago on September 16th, and after a tour through Yellowstone Park, Wyoming; and visits to Butte and Anaconda, Montana; and the Coeur d'Alene district, Idaho; Spokane was reached on the evening of Monday, 27th.

Owing to lateness of arrival, the opening session was postponed from Monday evening to the following afternoon, Tuesday morning having been occupied by attending the reception of President Taft by the citizens of Spokane. The sessions were held in the Masonic Temple. E. J. Roberts, chairman of the local reception committee, opened the meeting, and J. C. Ralston, city engineer, in the unavoidable absence of the mayor, who was in attendance on the President's party, cordially welcomed the visitors. He commenced his address by stating that mining commenced on the American continent when Ferdinand and Isabella of Spain grubstaked Columbus, and later said that within the last two months an Irrigation Congress had been held in Spokane, attended by 1500 delegates. In this connection he mentioned that the agricultural produce from the country tributary to Spokane had an annual value of about \$14,000,000. On the present occasion, including their Canadian friends, there were less than 150 delegates representing mining which, over the same territory as that just referred to, has an annual mineral production of a value of about \$40,000,000.

Dr. R. W. Raymond, at the request of Dr. D. W. Brunton, president of the council of the A.I.M.E., responded to the address of welcome, and in the course of a characteristically appropriate reply, alluded to the individual enterprise, skill, and courage of the typical mining engineer. One of the happy remarks made by the venerable secretary of the A.I.M.E. was that the mining engineer "should overcome the resistance of nature, including human nature, and one of the greatest resistances of human nature he has to overcome is the board of directors."

Dr. Brunton read his presidential address, which was on "Modern Progress in Mining and Metallurgy in the Western United States." Those who took part in the lengthy discussion which ensued were: Prof. Wm. Kent, Charles Catlett, Dr. W.O. Snelling, E. S. Hutchinson, Chas. W. Goodale, W. L. Saunders, Ernest Levy (Rossland, B.C.) and Thomas Kiddie.

The evening session was opened by the reading of Dr. Brunton's paper on "Modern Practice of Ore Sampling." During the discussion that followed, Thomas Kiddie read his paper on "Causes of Variations in Ore Sampling," which he had presented at the meeting of the Canadian Mining Institute held the previous week in Nelson, B.C. A paper by Franklin Bache, Fort Smith, Ark., on "Dust Explosions in Coal

Mines," was read by the secretary, and after discussion an adjournment was made until next morning.

On Thursday morning the third and final session was held. This was a joint meeting with the western branch of the Canadian Mining Institute, so Dr. Brunton courteously invited Thomas Kiddie, chairman, and E. Jacobs, secretary of the branch, to sit with him on the dais. A paper on "The Ruble Hydraulic Elevator," by J. McD. Porter, Spokane, was first read, and was discussed by Professor Kent and Dr. Raymond.

In the paper, "How may we Conserve our Coal Supplies," by Edward W. Parker, Washington, D.C., the writer, after alluding to the almost universal interest lately manifested in conservation, offered a few suggestions regarding the possible necessity of some restraint or control of the coal mining industry, with which he had been somewhat closely associated for the last 20 years. Passing reference was made to the suits brought by the Government against the anthracite operators in Pennsylvania, and the opinion was expressed that the present situation in the anthracite region has been developed through sheer necessity if the conservation of the supply of anthracite and the prolongation of the life of the fields in the best interests of the people is to be attained in any other way than through Government control, which latter does not seem to be materializing. The past profligate waste in anthracite mining has only been remedied by the close control and conservative management brought about in recent years, due in no small measure to the efforts of Dr. Raymond, Eckley B. Coxe, P. W. Sheaffer, Franklin B. Gowan, William Griffith, and a few others, through whose efforts many reforms in the lessening of the waste of anthracite were effected. Under conditions prevailing prior to 1887, when the anthracite coal commission made its report, it was estimated that for every ton of coal mined and sold, 1 1-2 tons were lost—much of this in pillars left to protect the workings, and millions of tons of small coal or screenings thrown on the culm banks. Improved methods of mining and preparation have of late years reduced the percentage of waste, so that at present the recovery will average about 60 and the loss 40 per cent., while by means of washeries much usable coal is being saved from the culm banks.

While the securing of the close control existing in the anthracite region of Pennsylvania has been made possible by the comparatively limited area of the fields (less than 500 square miles, with conditions ideal for a natural monopoly), it is different with the bituminous fields. The latter are scattered over some 30 different States and Territories; they aggregate about 250,000 square miles in area, exclusive of approximately equal areas of lower grade coals and lignites; and are for the most part so easy of access that frequently but a small amount of capital is necessary to develop a mine. In 1907, its banner year of industrial activity, the United

States produced nearly 400,000,000 tons of bituminous coal (including about 8,250,000 tons of sub-bituminous coal and lignite). In 1908, in spite of the business depression, the production was 332,500,000 tons. If the railways were to supply cars and motive power it would be practicable to produce from mines already open 600,000,000 tons of coal annually, and this without working Sundays or holidays to do it, but the markets could not absorb this larger quantity, which if we produced would create a surplus and cause general demoralization in values. Yet new properties are being opened and demands made upon railway companies for additional transportation facilities. One effect is to scatter the miners, reducing the supply of labour and curtailing the productive capacity of the older mines, the reduction of output meaning increased cost of operation and the risk of closing down as unprofitable before all the available coal has been extracted from these mines. Under the existing system of government and control over mining operations, there does not seem to be any effective way of curbing the tendency to new development or protecting capital already invested in the industry, nor is there any hope that State legislatures will plan any restrictions upon the industry which will discourage new development. Yet every new mine opened has its influence on the creation of a surplus, which, while it may seem desirable to those who clamor for cheaper coal, is ultimately destructive of industry, lowers wages, and makes necessary the practice of economies that are prejudicial to safety, to life and property in the operation of the mines.

While the suggestion that the bituminous mines should be put under some sort of Government control is bold, the opinion was frankly expressed that before many decades it will be necessary, for the protection of capital already invested, to secure control by private enterprise certainly of the areas containing the higher grades of coal, and to regulate the production according to market requirements. The choice of three evils would seem to be open: (1) The continuation of existing conditions—a feasting for to-day and remorse for to-morrow; (2) ultimate control by a combination of interests that will make the “hard coal trust” appear insignificant, and the “water power trust” of even less importance; and (3) governmental supervision and regulation—not ownership, however. The first will continue to be bad, the second would be worse, the third is problematical. Control by the several States may be suggested as a fourth, and best, alternative, but under competitive conditions referred to it is not to be expected that the States will undertake to restrict developments in their respective jurisdictions any more than they will enact legislation restricting the miner in his personal liberty.

Apropos of the personal liberty of the miner, it was mentioned that not the least difficulty experienced in operating a coal mine is the enforcement of necessary discipline among the mine employees. The concluding part of the paper dealt with accidents and disasters in coal mines, and the frequent tendency to carelessness on the part of miners, which in some cases results in much loss of life.

E. Jacobs read “Notes on the Coal Resources of Southeast British Columbia and of Alberta.” He prefaced his subject by briefly reviewing the situation relative to the occurrence of coal in the northern parts of the United States and contiguous southern parts of Canada, showing that there are extensive areas of the latter country which now obtain, and will continue to

do so, their supply of coal from the States, and vice versa, there are parts of the States the most convenient and economical sources of fuel supply of which are in Canada. The desirability of free trade or reciprocity in coal between the two countries is, therefore, self-evident, duty on coal being a tax on industry, which hits consumers on both sides of the international boundary line, without giving any compensating advantage to either side. Generally, the position seems to be this: There is an enormous quantity of coal of excellent quality in Canada—in the Maritime Provinces, in the east; and in British Columbia and Alberta, in the west—but practically none in about 2000 miles of territory situated between Alberta and New Brunswick. On the other hand, there is no coal in the north-eastern States; none thence, immediately south of the international boundary line (excepting in Michigan) until North Dakota is reached, and here lignite coal occurs; then there is coal in the Rocky Mountain region—in Montana and Wyoming, and again coal (though not of nearly so good quality as that in British Columbia and Alberta) in the State of Washington. So it would appear, in these circumstances, that the natural position would be for the Maritime Provinces of Canada to be the chief source of fuel supply for the New England States, and for Alberta and British Columbia to stand in similar relation to the Pacific States, while Pennsylvania and other States’ coalfields should supply Ontario and adjacent portions of the other Canadian Provinces that lie immediately east or west.

The immense coal resources of south-eastern British Columbia and Alberta were indicated by numerous quotations of facts and figures from reports of officials of the Geological Survey of Canada—Dr. Selwyn, Dr. Geo. M. Dawson, D. B. Dowling, W. W. Leach, and Jas. McEvoy—and from other published accounts of these coalfields. Of the Crow’s Nest coalfield, in British Columbia, the late Dr. Dawson wrote (for the “Mineral Industry,” to the end of 1898, p. 200): “This field, although it has not yet been fully defined, must have an area of at least a couple of hundred square miles. There are numerous superposed seams, ranging in thickness from 2 to 30 feet, and although the whole series, supposed to comprise about 20 seams, covers only the central part of the field, it is already manifest that we have here one of the most remarkable coal basins known. Dr. Selwyn roughly estimated the coal underlying each square mile, in one part of the field, at 49,952,000 tons. Later explorations by Geological Survey officials and others have led to the discovery of other very important occurrences of coal, some of which appear to warrant the expectation that extensive development will disclose the existence of an enormous tonnage of bituminous coal suitable for steam or coking purposes.

Among other information quoted relative to coal in Alberta was the following (taken from an article by D. B. Dowling, in “Economic Geology,” vol. iv., No. 1, Jan.-Feb., 1909): “The coal is found in three distinct horizons in the Cretaceous . . . . The estimate of area and coal content for these three formations may be summarized from the foregoing information thus:

|                                 | Sq. Miles. | Million Tons. |
|---------------------------------|------------|---------------|
| Kootanie formation . . . . .    | 288        | 7,930         |
| Belly River formation . . . . . | 6,000      | 26,000        |
| Edmonton formation . . . . .    | 12,800     | 71,000        |
| Total . . . . .                 | 19,008     | 104,930       |

As an example of the quantity of coal a single company is estimated to possess, the following was taken from a report, by Jas. McEvoy, of the coal lands held by the German Development Company, Limited, of Ottawa, organized about two years ago: Kananaskis coal lands—area, 7 7-8 sq. miles or 5040 acres; 10 workable seams of coal aggregating over 70 feet; estimated total quantity of coal on the lands, 519,750,000 tons, of which 75 per cent. can be actually taken out, or 4000 tons a day for over 320 years. Bighorn coal lands: Area, 5 sq. miles or 3200 acres; 124,000,000 tons of coal, or at least 2000 tons a day for 175 years. Brazeau coal lands: Area, 4 sq. miles or 2560 acres; at least 198,000,000 tons of coal or 4000 tons a day for over 140 years. These lands are all in the western part of Alberta.

Brief particulars were given of anthracite mining at Bankhead and Canmore, Alberta, of the big breaker, and the coal briquetting plant at Bankhead; of the operations of a number of bituminous mines in the Blairmore-Frank district; of an enormous deposit of coal at the Corbin mine, in the Crow's Nest Pass district, where a thickness of quite 200 feet of clean steam coal occurs; coke making, in either beehive or Belgian ovens, at Fernie, Hosmer, Michel, Coleman, and Lille; and of modern tipples, power plants, general equipment and mining methods, at various collieries in the region under notice.

The last paper read was one by W. D. L. Hardie, of Lethbridge, Alberta, on "The Galt Coal Field." This field was described as extending from where the St. Mary River joins the Belly River, above Lethbridge, to Grand Forks, at the Bow and Belly Rivers, below Lethbridge; the workable and merchantable coal spreading out about two miles on each side of the Belly River. Throughout the merchantable area the coal averages 4 feet in thickness, though in the neighborhood of Lethbridge it averages 52 in. There are two distinct seams, almost invariably divided by one to two inches of fire-clay, or a streak of bone coal one to six inches thick.

Assuming that the coal extends only two miles on each side of the river, that it is 4 feet thick, and that the distance from the St. Mary to the Grand Forks is 75 miles, the area will produce, making liberal allowances for loss of coal in mining, 1,253,376,000 tons. Besides this main area, there are several known detached areas, and others are likely to be discovered.

An average of several analyses gives the following: Moisture, 7.75%; volatile matter, 30.72%; fixed carbon, ash, 10.71 per cent. These analyses, however, do not show the percentage of hydrogen in the volatile matter. Before the opening of the Crow's Nest field this coal was largely used by the Canadian Pacific Railway, in locomotives and stationary plants. There is still a heavy demand for coal.

At the present time there are plants in operation of a daily capacity of 4,000 to 5,000 tons of Galt coal, and others are under construction which in a few years will double this daily output. One of the finest coal handling plants in Canada is now being installed at the Galt No. 6 mine, where two shafts have been sunk to a depth of 410 feet—one a hoisting shaft 20 ft. 2 in., by 21 ft., 2½ in., and the other an air shaft 20 ft., 8 in. by 10 ft. in the clear, both timbered with 10x10 in. square sets, backed with 3-in. plank.

Following the reading of these papers, numerous questions were asked concerning mining in British Columbia. These were replied to by W. Fleet Robertson, of Victoria, Frederic Keffer, Greenwood, and

Thomas Kiddie. Prof. Milner Roberts, dean of the school of mining, at Washington State University, Seattle, gave some information relative to the Nicola Valley coal field, B. C., and Prof. F. A. Thomson, chief of the mining engineering department at the State College, Pullman, Wash., spoke on mining in other parts of British Columbia.

Before adjourning the meeting, Dr. Brunton thanked the Canadian visitors for the part they had taken in making the joint session of the two institutes interesting.

While in Spokane and vicinity, opportunity was afforded the visitors of inspecting the several hydro-electric and steam generating plants of the Washington Water Power Company. These are: At Post Falls, 6,600 kw., 11,500 h. p., height of fall 55 feet; at Spokane 8,250 kw., 11,000 h.p., height of fall 75 feet; total fall in the city, 144 feet. The steam plant in Spokane is 15,000 kw., 20,000 h.p. The new plant, in course of erection at Little Falls, is four 5,000-kw. units—20,000 kw., 27,000 h.p., height of fall 68 feet. The new W.W. P. sub-station at Post Street is for transforming and distributing 30,000 kw. The voltage of the high-tension transmission line to the mines in Coeur d'Alene district is 60,000 volts. The plant of the Inland Empire railway system at Nine Mile has a capacity of 6,000 kw. A number of the party examined a large and representative mineral exhibit, which had been left intact from the annual exhibition held a week previously. A few visited the tin mine, near Spokane. It is noteworthy that a badge presented to the visitors was made from Spokane tin.

A complimentary banquet to the visitors, tendered by the leading citizens of Spokane, was held on Wednesday evening; at this covers were laid for 200. On Thursday the A.I.M.E. party proceeded to Seattle, to visit there the Alaska-Yukon-Pacific Exposition.

The sixth general meeting of members of the western branch of the Canadian Mining Institute, was held at Nelson, B.C., on Saturday, September 25. Thomas Kiddie, chairman of the branch, presided, and there was a fair attendance of members and visitors.

#### Chairman's Address.

After calling the meeting to order, the chairman said: "You will remember, gentlemen, that it was here in Nelson, on Jan. 15, 1908, this branch of the Canadian Mining Institute was organized. The branch started with a membership of about 130, and the expectation then was that by the end of 1908 the number would be increased to 200. This was practically realized, but not quite; to-day, however, there are on the printed list of branch members 197 names, while several more are before the council for enrolment, so that we may now claim 200 as the number of members of the branch.

"It gives me much pleasure to welcome in Nelson to-day, Mr. R. W. Brock, director of the Geological Survey of Canada; also Mr. W. F. Robertson, provincial mineralogist for British Columbia. Both are valued members of the institute and active members of its council, and Mr. Robertson is the present senior vice-president of the institute. The Geological Survey, during many years past, has done and is continuing to do, valuable work in the west as in other parts of the Dominion—in Alberta, with its immense coal fields, now attracting increasing attention; in the Yukon, where there are coal and lode mines, as well as large areas of gold-bearing gravels for placer mining, and in British Columbia. In this province particularly the Survey is extending its useful work—this season in Sheep

Creek and the Slocan (in both of which the city of Nelson has considerable interest); in the big Similkameen district on Vancouver Island, and in the Skeena country in the northern part of the province. I hope Mr. Brock will this morning give us the benefit of hearing from him something relative to the excellent work his department is doing in the west, which is indeed fortunate in having as director of the Survey so good a friend to it as he is known to be—one with an intimate and practical knowledge, obtained during years of field work in this western country, of its great promise of immense mineral wealth, and who, further, is believed to be thoroughly in sympathy with the West. Again we are fortunate in that the Dominion minister of mines is a western man and a representative of a British Columbia constituency, so that this province may confidently look for the continued consideration of, and derive much benefit from, the work of the Geological Survey branch of the Dominion Department of Mines."

In the course of his opening address the chairman first called attention to the satisfactory increase in the number of western members of the institute, there now being about 200, as compared with 130 when the branch was organized in January, 1908. He next extended a cordial welcome to R. W. Brock, director of the Geological Survey of Canada, and W. Fleet Robertson, provincial mineralogist for British Columbia, both of whom had come to Nelson to attend the meeting. The valuable topographical and geological work the Survey has done and is continuing to do in the west was mentioned in terms of appreciation, as, too, was that of the British Columbia Bureau of Mines under the direction of the provincial mineralogist. Reference was next made to the forthcoming joint session of the western branch of the Canadian Mining Institute with the American Institute of Mining Engineers at Spokane, and the opinion was expressed that the reading in that city of papers on the coal resources of south-eastern British Columbia and Alberta, and the discussion that would follow, must prove of material service to the coal mining interests of the great coal districts to have the attention of the joint meeting. The sterling good work the Nelson Board of Trade is doing in furthering the interests of mining among other district industries was suitably acknowledged, and thanks were expressed for the kind courtesy of that body in placing its rooms at the disposal of the institute for the purpose of holding that day's meetings.

"It is also gratifying to see here Mr. Robertson, whose duties as provincial mineralogist have unfortunately heretofore prevented him from attending the meetings of the branch. Last autumn he made a special effort to get back to Victoria in time to be present at our meeting there on the occasion of our welcoming to the province the Canadian Mining Institute summer excursion party, which included many notable men from Europe as well as prominent geologists, mining engineers and metallurgists of North America. Notwithstanding, though, that a canoe journey of hundreds of miles was taken, Mr. Robertson was unable to reach Victoria while our meeting was being held, though he did succeed in arriving at Vancouver in time to spend a day there with our distinguished visitors. I am glad to find him this season engaged in doing field work in East and West Kootenay and I have no doubt these districts will be gainers as a result of his investigations.

"I have much pleasure, too, in mentioning the forthcoming joint session of this branch with the American Institute of Mining Engineers, to be held at Spokane,

Wash., next week, and I am hopeful quite a number of our members will be able to go to that city to attend the meeting and to assist in welcoming the A. I. M. E. party to the west. It is a matter for regret that that meeting has interfered to some extent with the attendance here to-day, but there are some of our busiest members who cannot spare sufficient time to admit of their attending both the Nelson and Spokane meetings, so they have chosen the latter. We cannot fail to realize that the reading in Spokane of papers on the coal resources of south-eastern British Columbia and of Alberta, and the discussion that will follow, must prove of material service to the coal mining interests of the great fields situated to the east of the metalliferous mining district in which we are to-day.

"On behalf of this branch I desire to express our appreciation of the thoughtful courtesy of the Nelson Board of Trade in placing at our disposal its rooms for the purpose of holding our meeting to-day. This board is doing sterling good work in directing widespread public attention to the great natural resources and advantages of the Nelson district. Its efforts in furthering the interests of those engaged in the mining industry are deserving of our thanks, and we, as members of the Canadian Mining Institute, may well express our thanks for the benefit the mining industry, among others, is deriving from the well-directed efforts of the board. By preparing the useful pamphlet on mining, copies of which are at your disposal to-day; by the very creditable displays of ores made at the Alaska-Yukon-Pacific Exposition, and at the respective exhibitions at Toronto, Spokane and here in Nelson, the mineral resources of the Kootenay are being well advertised by this board, and we take pleasure in expressing our appreciation of the value of the work thus being done."

E. Jacobs, of Victoria, B.C., secretary of the branch, then read the following review of the progress of mining in the province during the expired months of the current year.

"The third quarter of the year closes with the mining industry of British Columbia on the whole in a satisfactory condition. In most of the districts that contribute to the annual mineral production of the province there is activity at the mines, and in some the outlook is more promising than earlier in the year. Work has been resumed on several properties that had been inoperative for a more or less lengthy period, and in other instances development work has been undertaken that will probably eventually result in adding to the number of producing mines.

"Taking the economic minerals separately, the following comment is made:

"Gold.—While it is yet early to make an estimate of the quantity of placer gold produced this year, the opinion may be expressed that an increase over last year's production may not reasonably be looked for, the gravel-washing season having been opened later than in some years with the resultant comparatively short period of operation at the more important placer mines. Then there was the carrying away of the North Columbia Company's dam at Surprise Lake, in Atlin camp, which prevented as large a recovery of gold as would have been made had the expected increased quantity of water been available for hydraulicking. In Cariboo Mr. John Hopp, who operates on a larger scale than any other placer miner in that district, had a satisfactory season, his gold returns having been good for the time worked. The close of the season was occupied by Mr.

Hopp in making dams and other provision to secure an enlarged supply of water for future operations. Mr. H. W. DuBois, of Philadelphia, U.S.A., let a contract late in the season for ditch and flume construction to provide a water supply for another Cariboo property. Mr. J. B. Hobson spent the season in the Quesnel Forks district, but no information concerning his operations has yet been made public. Other placer miners, both individuals and companies, worked in Cariboo and Atlin camps and on a smaller scale in North-east Cassiar and East Kootenay. Not much information was published relative to the Ingenika field, from which a good yield of gold had been expected. Dredging for gold, of which very little has been done in the province during quite recent years, is to be tried again, the holders of dredging leases on Fraser River above Lytton having made arrangements after having prospected their gold-bearing gravels, to install dredging plant believed to be adapted to local conditions and capable of being operated profitably. Before turning from placer gold, mention should be made of the fine collection of nuggets from Yukon and British Columbia placer fields purchased lately by the Dominion Government and placed on exhibition at the Alaska-Yukon-Pacific Exposition, Seattle.

"The outlook for an increasing production of lode gold is considered favourable, both at mines where gold is the chief valuable constituent of the quartz or other ore, and where it is associated with copper. The recently reported sale of the Nickel Plate group and 40-stamp mill in Hedley camp, Similkameen, is regarded as indicative of more activity there, while at several smaller mines in the same camp steady progress towards regular production has been made. The provision of railway transportation facilities for this district will probably give an impetus to mining and consequently mineral production to an appreciably large extent. In Nelson mining division, which embraces the gold camps in the near vicinity of the town of Nelson, and those at Ymir, Salmo, Sheep Creek and Erie, there has been substantial advancement in lode-gold mining during the current year, and it is expected that there will be a steady increase in the output of gold from this district. Important developments have recently taken place at the Queen mine, Salmo, and as well at several of the Sheep Creek properties. Prospecting in Summit camp, situated between the Salmo district and Kootenay Lake, to the eastward, has given encouraging results. Another discovery of gold quartz in Cariboo district has lately been reported, but its importance has yet to be determined.

"Silver.—There does not appear to have been much change in conditions relative to the production of silver in the province. Slocan and Ainsworth mines have continued to contribute to the total of production, and the St. Eugene at Moyie Lake has steadily maintained its output of this metal from its considerable production of lead-silver. In smaller quantity silver has come from mines in Nelson division; also from the Lardeau, chiefly from the Silver Cup group in Ferguson camp. Portland Canal district and some claims in the Skeena country, on which silver-bearing ore has been found, may be expected to add to the silver production later, but as yet they are non-producers. The copper mines of the Boundary and Rossland camps, and in much smaller degree those of the Coast district, yield a considerable proportion of the annual output of silver, which occurs in many of the mines in association with copper and gold. At the Marble Bay mine, on Texada island,

the quantity of silver found in the copper ore has become greater as depth has been reached, the ore at between 800 and 1,000 feet depth averaging higher in silver than nearer the surface.

"Lead.—East and West Kootenay mines still produce practically all the lead included in the total mineral production of British Columbia. The St. Eugene, in the former district, and the Blue Bell and Whitewater, in the Ainsworth division of West Kootenay, are the larger producers. Work has lately been resumed on the Sullivan group, in East Kootenay, so that this property may be expected to put out shortly a fairly large quantity of lead. Other mines contributing more or less to the total lead production are the Rambler-Cariboo, Richmond-Eureka and several others in Slocan district; the Silver Cup at Ferguson, and the Emerald at Salmo, while lead is also obtained from concentrates from mines in Nelson and other divisions.

"Copper.—The Boundary is the chief source of copper in British Columbia, and indeed in Canada. The mines in that district of the Granby, British Columbia Copper, and Consolidated Mining and Smelting companies, respectively, are regular producers on a comparatively large scale, the Granby being far in the lead with the British Columbia Copper Company next. The mines of the last-mentioned company were idle during several months of the year, while the Granby operated with little or no interruption. The Consolidated Company closed its Snowshoe mine for a time but lately the output of ore from that mine has been larger than during most earlier periods of its history. Several smaller mines in the Boundary have been worked, notably the Bruce at Midway, which shipped 210 tons of ore to the British Columbia Copper Company's smelter at Greenwood, but on the whole the production of these has been small. The total production of ore from all Boundary mines has been about 1,000,000 tons for the nine expired months of 1909, of which approximately 700,000 tons was from Granby, 200,000 tons from the British Columbia Copper, and 100,000 tons from the Snowshoe.

"Rossland camp, with a total production during the same period of 170,000 to 180,000 tons of ore, has been the only other large producer of copper this year. Of the quantity mentioned, nearly 130,000 tons came from the Centre Star group of mines, owned by the Consolidated Mining and Smelting Company of Canada, Ltd., while the Le Roi No. 2 mined well on for 40,000 tons, and the Le Roi between 7,000 and 8,000 tons. The last-named mine is now at work again, doing development and diamond-drilling only, after a suspension of about six months.

"There appears to be a prospect of Kamloops properties next year adding to the copper production of the province, but during the current year their output has not been considerable.

"In the Coast district copper mining has been quiet on the whole, though the outlook for a marked improvement is considered encouraging. The chief exception to the general non-productiveness was Texada Island, where the Marble Bay mine in particular made an excellent showing, having developed a valuable deposit of bornite ore down to nearly 1,000 feet depth. The Tye Copper Company was operating the Indian Chief group, at Sidney Inlet, west coast of Vancouver Island, for a time and shipped a quantity of ore of good grade to its smelter at Ladysmith. Outside of this, though, copper mining on Vancouver Island has been of little importance for some time past. The smelter at

Crofton has been idle for many months, production at the Britannia mine, on Howe Sound, from which it obtained its chief supply of ore in recent years, having been very much reduced, and the smaller quantity of ore and concentrate having been sent to Ladysmith for reduction. The Swayne group, in Lynn Creek camp, near Vancouver, has been steadily developed, latterly by the Tyee Copper Company. While the supply of local ores has been small this year, that from south-east Alaska has been considerable, and from that source has come most of the 45,000 tons smelted by the Tyee Copper Company at Ladysmith during the twelve months to August 31st last. Prospects appear good for a substantial production of copper ore from properties on Moresby Island of the Queen Charlotte group. It is stated that the Ikeda mine, operated successfully by the Awaya-Ikeda Company, of Vancouver, is under option to Scottish capitalists. Incidentally it may be mentioned that Vancouver men are giving attention to copper properties on Texada Island, with a fair chance of success.

"The completion of a railway into the Similkameen country may bring about a decided improvement as regards copper mining in that district, lack of economic transportation having heretofore prevented the development of the industry there.

"Zinc.—Despite the higher tariff charges on zinc going to the United States, there has been a larger quantity of zinc ores and concentrates shipped from Slocan and Ainsworth mines to the States during the current year than in the corresponding period of 1908. Most of this has been from the Lucky Jim mine, in eastern Slocan. Other producers of zinc have been the Blue Bell and Whitewater group, in Ainsworth division, the Ruth at Sandon, Slocan and several other mines.

"Iron.—There has been no recent production of iron in British Columbia. From time to time somewhat glowing accounts of the occurrence of iron ore in large quantities on Vancouver Island in particular, have been published, but these have generally been indefinite and not supported in important detail by well-known and competent iron mining men. The preliminary report of Einar Lindeman, a Swedish iron ore expert employed by the Dominion Government to ascertain local conditions relative to the occurrence of iron ores, their manufacture and sale of the product, is the only published official information of comparatively late date available for reference. As a matter of fact there has as yet been comparatively little development of the iron ore deposits, so the permanence or otherwise of the supply remains, under these circumstances, undetermined. Meanwhile, though, there is good reason to think that genuine efforts are being made to establish on the coast of British Columbia a plant for the manufacture on a commercial basis of iron from local ores. Whether this desirable object can be accomplished remains to be seen but if it be brought about it will not be as a result of existing extensive development of the ore deposits, since on Vancouver Island they are still largely undeveloped. Better conditions obtain, though, at the Iron mine, Texada Island, where there has been considerable development and a fair amount of ore production.

"Coal.—Coal mining operations in British Columbia were enlarged during 1908 and 1909 and are still being extended, both on the mainland and on the coast. In the Crow's Nest Pass region both the Crow's Nest Pass Coal Company and the Hosmer Mines, Ltd., are main-

taining a large output and the Corbin colliery, in the same district, is steadily increasing its production. The extensive coal seams of the upper Elk River are awaiting the construction of a railway to admit of their shipping coal, of which there is a large tonnage available, and that of excellent quality. In Nicola Valley the mines of the Nicola Valley Coal and Coke Company, of Vancouver, are again producing, labour difficulties having been arranged. Other companies operating in the same district are preparing for regular production. The promised early completion of a railway to Princeton, Similkameen, has encouraged the Vermillion Forks Mining and Development Company to arrange for additional equipment for its coal mine in that neighborhood, so as to be able to soon ship coal continuously. On Vancouver Island both the old established companies, the Wellington Colliery Company and the Western Fuel Company, have produced much coal this year, while the South Wellington Coal Mining Company has built a railway to tidewater and constructed coal bunkers and other shipping facilities, which have allowed of its entering the market for the sale of its coal. Two or three important coal land deals for Vancouver Island properties, have lately been made, and it is expected that the opening of other coal mines will eventually be the outcome of these."

After E. Jacobs, of Victoria, secretary of the branch, had read a review of the progress of the mining industry of the province during the expired months of the current year, an adjournment was made to allow members to join members of the Nelson Board of Trade in welcoming Sir Thomas Shaughnessy, president of the Canadian Pacific Railway Company, who had just arrived in the city, and afterwards to inspect the comprehensive district mineral exhibit at the Nelson Exhibition closing that day.

#### Paper on Ore Sampling.

On reassembling after lunch Thomas Kiddie read a paper on "Causes of Variations in Ore Sampling." After stating that, so far as he knew, there is not any regular or standard method of determining the accuracy or otherwise of various approved mechanical ore samplers in use, and expressing the opinion that in the interests of both sellers and buyers of ores there should be sizing as well as chemical tests to determine whether there are important variations in the results obtained by standard samplers and sampling methods, Mr. Kiddie submitted a number of tables showing the results of numerous experiments he had made in the separation of metallic sulphides from silicates (or quartz) by the gradual crushing of sulphide ores, having a hard gangue, from  $3\frac{1}{2}$  to  $\frac{3}{8}$  in. approximately. These indicated that the proportions of certain constituents in the ores always increased while others decreased as the size of the portion dealt with in these sizing tests increased. Generally, the percentage of silica and alumina increased with the size of the ore, while the gold, silver, copper, iron, and sulphur decreased as the lumps of ore were larger. Applying this principle, a standard sampler was tested, with the result that it was found there was an appreciably large difference in the sizes of the ore discharged on opposite sides of the sampler, the variation indicating a possible source of serious error which may occur in determining the actual values of ore sampled by a riffle sampler. Another table showed the difference in results from sampling by riffle and cone methods, respectively. It was claimed that from the chemical analyses and the results of sizing tests exhibited by the tables submitted, there were great dif-

ferences in the metallic contents of the various sized particles of ore, and a consequent considerable variation in results obtained by present methods of sampling. Mr. Kiddie suggested that to prove the accuracy of sampling machines or methods of sampling it would be necessary to make up a sympathetic or artificial ore, the composition of which as regards sizes and contents of its component particles to be definitely ascertained, and then compared with those originally obtained from the sample. It was recommended that these determinations be made by a commission, or by the faculty of a school of mines or like institution. Mr. Kiddie called attention to the fact that his investigations had been in connection with one class of ore only. He mentioned that Dr. J. Bonsall Porter, of McGill University, Montreal, had read his paper, offered suggestions, and kindly undertaken certain work in further pursuit of this investigation; also that the results obtained will probably be given in a future paper to be prepared by Dr. Porter and himself jointly.

The subject of the paper was discussed by Messrs. W. F. Robertson (who incidentally suggested that the tables be produced in graphic form), E. W. Widdowson, M. J. Connolly, and others. A hearty vote of thanks was accorded to Mr. Kiddie for his interesting and valuable paper.

#### Other Business.

A paper on "The Galt Coal Field," prepared for the Spokane meeting by W. D. L. Hardie, of Lethbridge, Alberta, manager of the Alberta Railway and Irrigation Company's Galt collieries, was read by the secretary, and a vote of thanks to the writer was passed.

The death of Andrew Colville, a western member of the institute, formerly superintendent of the Crow's Nest Pass Coal Company's Coal Creek colliery, was reported by the secretary.

There was some discussion concerning an advertisement appearing in an Albertan newspaper relating to an alleged fraudulent mining company, and the secretary was instructed to refer the matter to the council of the institute for such action, if any, as that body shall think advisable.

It was decided to hold the next general meeting of the branch, due about the middle of January, 1910, in Vancouver B.C.

### INSPECTION OF MINES.\*

By J. A. Holmes, U. S. Geological Survey.

Mine inspection is and should remain a function of the State. It has for its purpose the proper execution of state mining laws; and the object of these laws is primarily the safety of the miners, incidentally the protection of mine property.

The agent of the state in the carrying out of these laws is the Inspector of Mines, and his assistants. These should be sufficient in number for frequent and thorough inspection; the basis for selection and continuance in office should be fitness for office and efficient service. They should be independent of political or other extraneous influences. They should receive compensation for services commensurate with the responsibility resting upon them, and the experience and technical training required. They should have reasonable laws to execute. They should have the willing co-operation

of both operators and miners in carrying out the provisions of the law. Under such conditions men of the best type will accept and hold these positions; and their actions will receive the support of public opinion and of the courts.

This inspection by officers of the state, whenever practicable, should be supplemented by the work of special inspectors employed by the mining companies. Many such companies have already adopted such a practice and report favourable results. In other coal mining countries this practice has become much more general. But in recommending to American coal operators the adoption of practices found successful in other countries, it should be remembered that the selling price of coal at the mines in the United States is generally less than half that in other countries; and this fact may render impossible here many improvements in behalf of safety and efficiency that the American operator would otherwise be glad to inaugurate.

The function of the Federal Government in connection with mine operations is one of inquiry and research, having in view two fundamental purposes:—

1. Greater safety for the lives of miners; and
2. The conservation of mineral resources.

In connection with ordinary mine inspection the special service rendered by these investigations will be:—

(a) The development of data such as will serve as a basis for the enactment of reasonable laws, rules and regulations;

(b) The establishment of facts which may serve as a basis for the settlement of disputes between inspectors and operators and operators and miners, either by courts or boards of arbitration.

The propriety of having such inquiries and researches conducted by the Federal Government in relation to mining will scarcely now be questioned in view of the fact that such policy has long since been accepted in relation to agriculture, forestry, fisheries, and other industries. But it may be added that the practice avoids extensive duplication of labour and expense by the states; the Federal investigations naturally cover a wider field of experience, including also experience in other countries, and the results are likely to be more generally accepted as impartial, being further removed from local influences.

Under such an arrangement there will be no basis of conflict between the State and Federal interests—no encroachment of one on the duties or rights of the other. The support of the Federal work will depend upon its securing and maintaining the good-will and co-operation of the state's inspectors; and the success of both the State and Federal work will depend upon their securing the proper friendly co-operation of the miners and operators.

Nor is anyone now likely to question the proposition that the conservation of resources is a national as well as a state problem. In the mining, treatment and use of mineral products no state boundaries are involved. An ore mined in one state may be milled in another, smelted in a third, refined in a fourth, and used in many different states. The coal mined in Pennsylvania or West Virginia may serve as a basis of heat, light, power for various manufactories in a dozen or more different states, and may be essential to the interstate transportation of mails, passengers and freight, while the manufactured products to be transported may in turn serve as an essential basis of other industries in the remotest parts of the country. The iron ore of Minnesota may in Illinois be mixed with coke from Pennsylvania and
